-----

1 WHEREUPON,

2 EDWARD FINE, M.D., Ph.D.,

3 after being first duly sworn, as hereinafter  
4 certified, testified as follows:

5 CROSS-EXAMINATION

6 BY MR. KULWICKI:

7 Q. Doctor, why don't you state your full name and  
8 spell your last name, and give us your current  
9 business address, where we're at today.

10 A. Edward Fine, F-i-n-e, 30033 Clemens Road,  
11 Westlake, Ohio 44145.

12 Q. And Doctor, you are a board-certified  
13 otolaryngologist; is that correct?

14 A. Yes.

15 Q. Do you hold any other board certifications?

16 A. No.

17 Q. All right. Now, in this case, Dr. Lenox has given  
18 the opinion that Ms. Formick's problems with  
19 regard to her spinal accessory nerve are related  
20 to an infection. Do you agree with that?

21 A. Yes.

22 Q. Tell me how many cervical lymph node dissections  
23 you've performed in the course of your career,  
24 roughly.

25 A. I'd say 50.

1 Q. And have you ever had this particular complication  
2 develop?

3 A. No.

4 Q. Have you ever had a complication develop wherein  
5 the spinal accessory nerve was compromised and the  
6 patient developed some type of palsy or injury  
7 related to that with the cervical lymph node  
8 dissection?

9 A. With a radical, more radical types of surgery,  
10 yes.

11 Q. As I understand it, there are varying degrees of  
12 lymph node dissection that you can do in this  
13 area, and the most radical would be one that  
14 involves the recovery of a number of lymph nodes,  
15 and then there's a modified radical, and then  
16 you've got what we have here, which would be the  
17 simplest of those procedures. Fair enough?

18 A. Yeah, that's pretty accurate; yeah.

19 Q. And with regard to the radical, you have had to  
20 sacrifice the spinal accessory nerve in the course  
21 of a radical dissection; correct?

22 A. Exactly.

23 Q. But you've never had this complication in the  
24 course of doing a simple resection of a single  
25 lymph node; correct?

1 A. True.

2 Q. I know what I wanted to ask you -- did you know  
3 Dr. Lenox before this case?

4 A. I know who she is.

5 Q. You trained at UH; she is affiliated with UH. Did  
6 you know her through that?

7 A. We had some vague interactions that, I think she  
8 trained at the clinic, mainly.

9 Q. Tell me about your vague interactions. What do  
10 you mean by that?

11 A. Well, I was a resident, and she was a -- maybe for  
12 a year or two, and I didn't really -- I don't know  
13 specifics.

14 She was an attending who was in the  
15 community, a community-based attending, which  
16 means she would do most of her surgeries, I  
17 believe out at that Green Road facility at this  
18 time.

19 Rarely, if she had a bigger type of case  
20 that she needed resident help with, she would do  
21 it at the University Hospitals main campus.

22 Q. Okay; and were there occasions when she had these  
23 bigger cases at the main campus that she would  
24 have, you would have been assisting her as a  
25 resident?

1 A. I would say rare. Maybe one; very rarely.

2 Q. Okay.

3 A. Typically she did most of her stuff out at Green  
4 Road.

5 Q. And then on either end of that, did you know  
6 Dr. Lenox before that interaction, or since then,  
7 have you had any interaction with her?

8 A. Well, because she works in Cleveland and I work in  
9 Cleveland, there's certain professional venues  
10 that we see each other at, but I don't socialize  
11 with her in any way or see her outside of the  
12 realm of those settings.

13 Q. Have you discussed this particular case with her?

14 A. No.

15 Q. Now, have you done any medical research with  
16 regard to any of the issues in this case?

17 A. Do you mean formal research on --

18 Q. Or informal. Have you looked at anything with  
19 regard to spinal accessory nerve injury as a  
20 result of cervical lymph node dissection?

21 A. Nothing recently. I mean, I didn't prepare per  
22 se.

23 Q. So specifically, with regard to this case, you  
24 didn't open up your computer or go into some books  
25 or whatever to look at anything?

1 A. No.

2 Q. Are you aware of any literature, based on your  
3 general knowledge, that specifically talks about  
4 nerve injury as a result of infection?

5 A. If you ask me to quote specific articles or  
6 chapters, I would be hard pressed to identify one  
7 or two things. There's a certain number of  
8 standard, you know, textbooks that usually we  
9 refer to.

10 Q. What would those be?

11 A. There's one called Bailey, which is sort of a  
12 standard ENT/head-neck surgery type textbook.

13 Q. Any others that come to mind?

14 A. Not off the top of my head.

15 Q. Now, when you in one of your 50 or so cases, when  
16 you do that, remove cervical lymph node, do you  
17 make yourself available for patient emergencies by  
18 carrying around a beeper and having a paging  
19 service where your patients can call if there's  
20 some postop complication?

21 A. Yes.

22 Q. And based on your training and experience, is that  
23 a standard practice for surgeons or ENTs who do  
24 this type of operation?

25 A. Yeah.

1 Q. And can we agree that it would be reasonably safe  
2 or careful to respond to a patient's complaints of  
3 inflammation or infection in the surgical site  
4 during the five-day period following this surgery?

5 A. Yeah, I would say it's reasonable for, you know,  
6 me or -- I mean, I've got a partner.

7 Q. So in other words, either you or your partner will  
8 cover?

9 A. Somebody's responsible, absolutely.

10 Q. Okay. With regard to the mechanism of injury, why  
11 don't you just tell me, if you would, what you  
12 think happened, and what led to this lady's  
13 injury.

14 A. As far as I can tell from reading what was -- the  
15 information that was provided to me, she had this  
16 biopsy done under what they call MAC, which means  
17 she wasn't completely paralyzed.

18 She was breathing spontaneously, which  
19 would key you into any concerns about injury to  
20 the nerve, usually, while the procedure's going  
21 on.

22 It sounded like from what I read that there  
23 was -- let me check and see -- but not  
24 immediately, but a day or two later, when there  
25 was a call made to Dr. Lenox's office indicating

1           that there might be some drainage from the wound  
2           and some weakening of the arm on that side.

3           That's the crux of what I saw or, you know, read  
4           about what was going on here.

5       Q.   Okay.

6       A.   That's the left side of the neck.

7       Q.   And in terms of your opinions that you'll give at  
8           trial, are you planning to explain how the  
9           infection led to damage of the nerve?

10      A.   Well, the way I would put it together is, first of  
11           all, by history, this area of the neck had been  
12           operated on before, and that can result in some  
13           scarring.

14                You don't have the normal tissue planes  
15           that can separate freely, and if there's an  
16           infection that develops postoperatively, that  
17           could impair functioning of the nerve. That's how  
18           I put together what happened here.

19      Q.   And tell me, if you would, specifically how an  
20           infection would impair the functioning of the  
21           nerve.

22      A.   Well, infection usually causes inflammation, and  
23           what is called the host response, which is the  
24           body's attempt to wall off and fight the  
25           infection.

1           If that whole process occurs adjacent to  
2           the nerve, it could potentially impair the  
3           functioning of the nerve.

4           Q.   So it would actually be inflammation of  
5           surrounding tissues compromising the nerve or  
6           pressing on the nerve, somehow causing --

7           A.   Impaired function.

8           Q.   -- impaired function; okay.  It wouldn't be  
9           something like the infection actually eating away  
10          at the nerve itself, would it?

11          A.   That would be very rare.  Depending on what type  
12          of bacteria it was, there's some unusual bacterias  
13          that can do that, but I think that would be  
14          unusual, very unusual.

15          Q.   Like the so-called flesh-eating bacteria?

16          A.   Exactly.

17          Q.   And there's no evidence that those were present in  
18          this case, is there?

19          A.   Not that I can see.

20          Q.   Now, let me back up:  You talked about MAC, and  
21          can you tell me what that stands for?

22          A.   I'm sorry.  MAC stands for monitored anesthesia  
23          care.  There's usually -- and again, I'm not an  
24          anesthesiologist; this is my perception.

25                There's usually three components of

1 anesthesia: One is amnesia, one is pain control,  
2 and one is muscle paralysis; and if you're going  
3 to operate in an area that you are concerned about  
4 the nerve and nerve functioning, you want to be  
5 able to monitor that nerve during the course of  
6 your procedure.

7 And monitored anesthesia care means you can  
8 have amnesia and anesthesia, but you don't  
9 necessarily have to have muscle paralysis.

10 So if you're getting near a nerve,  
11 stimulating it or irritating it, you would expect  
12 a sign of that specifically; the arm to move or  
13 the patient to twitch or something like that.

14 Q. Now, in reading the records myself, I don't see  
15 specifically any reference to MAC. Is it  
16 specifically referred to as monitored anesthesia  
17 care or MAC in the records?

18 A. Give me a moment.

19 Q. I guess you looked at the operative note. I do  
20 see it now.

21 A. Yeah.

22 Q. Do you see the operative note? Actually,  
23 underneath where it says "Anesthesia," I see MAC  
24 there now.

25 A. Right.

1 Q. Now, even with MAC, there is a local anesthetic in  
2 the area where the incision is being made; is that  
3 correct?

4 A. Exactly. You're right.

5 Q. And can that cause some anesthesia of the nerve?

6 A. Usually that anesthetic that's injected is  
7 injected very superficially; if it wasn't injected  
8 superficially, and by "superficially" to actually  
9 numb the skin, most of the sensory nerves in this  
10 area are in the skin, and once you get through the  
11 skin, pretty much anything under that is not real  
12 sensitive to pain.

13 Q. Okay.

14 A. And -- but you're right; if you were to inject it  
15 deep, you could have some numbness of or  
16 anesthesia of the nerves.

17 Q. And might that impair its response to being  
18 compromised intraoperatively?

19 A. That's a possibility.

20 Q. Now, in Dr. Lenox's description of the surgery,  
21 does she describe any unusual anatomy in this  
22 patient?

23 A. Let me just review it for a moment just to be  
24 sure.

25 Q. You bet.

1 A. No, it doesn't sound like there was anything  
2 unusual done, or unusual anatomy described.

3 Q. Does she describe encountering any difficulty in  
4 dissecting the spinal accessory nerve away from  
5 the lymph node that was removed?

6 A. No.

7 Q. Now, in your practice, do you typically identify  
8 the spinal accessory nerve during this particular  
9 type of surgery?

10 A. I would not, as a routine.

11 Q. All right. Would you typically describe it in  
12 your note, either as being not identified or  
13 identified and isolated?

14 A. I might describe it as not being identified; not  
15 as a routine, though.

16 Q. Now, in the 50 or so cervical lymph node  
17 dissections that you've performed, did you use a  
18 local anesthetic as opposed to general anesthesia?

19 A. Usually, yeah. You use this MAC; is that what you  
20 mean?

21 Q. I guess so. I guess what I'm referring to is  
22 local as opposed to general, and I assume MAC is a  
23 form of local anesthesia?

24 A. Yeah, it's sort of an attended local, which means  
25 you have an anesthesiologist by. Yeah; this is,

1 in my mind, the preferred technique, because you  
2 do have concerns about injury to that nerve.

3 Q. Okay. In fact, have you ever done a simple single  
4 lymph node resection in the cervical region under  
5 general anesthesia, or has it always been with  
6 local or MAC?

7 A. No, I have done it under general anesthesia, too.

8 Q. And under what circumstances would you do that?

9 A. Usually if it's a kid -- a child, someone who may  
10 not be able to sort of handle some of the stress  
11 associated with sort of being in the twilight  
12 sleep, you just put them to sleep. It sort of  
13 helps you control the surgical situation.

14 Q. Now, you made a statement earlier that when  
15 there's monitored anesthesia care, that if there's  
16 injury to the nerve intraoperatively, the response  
17 of the associated muscle usually keys you in to an  
18 injury to that nerve, and the way you said it was,  
19 it usually keys you in; and I want to focus on the  
20 qualifier of "usually."

21 A. Uh-huh.

22 Q. And ask if it's possible that you can cause injury  
23 to the nerve and not have some physiological  
24 response in the associated, the enervated muscle.

25 A. At the time of surgery?

1 Q. Yes.

2 A. Well, if you had infiltrated, or injected would be  
3 a better term, lidocaine into the area, you could  
4 anesthetize the nerve, and then if you came close  
5 or stimulated it and were expecting motion or some  
6 sign, you might not get it.

7 Q. Now, in terms of draping the surgical area, what's  
8 your typical practice? How much draping do you  
9 do, and what would you expect to be exposed on the  
10 patient?

11 A. Typically, I would put a shoulder roll under the  
12 patient to extend the neck, turn the head, in this  
13 case to the right so the left neck was exposed,  
14 and drape an area that's probably three or four  
15 inches on a side.

16 Q. And would you expect, for instance, the shoulder  
17 area to be covered in draping during this  
18 procedure?

19 A. I typically would do that.

20 Q. Now, are there techniques that you use during  
21 cervical lymph node dissection to protect against  
22 injury to the spinal accessory nerve?

23 A. For an isolated lymph node that you're concerned  
24 with like this case?

25 Q. Yes.

1 A. Besides using the monitored anesthesia care and  
2 being sure or trying to be sure that I inject  
3 superficially so you don't impair the ability of  
4 the nerve to function, I routinely don't use --  
5 there's some monitors that you can use for more  
6 extended types of dissection. That isn't usual  
7 for me, what I would do.

8 Q. But in terms of the actual procedure itself, I've  
9 heard it described as gently teasing the lymph  
10 node away from the surrounding tissue so as not to  
11 cause injury to the nerve.

12 A. Okay.

13 Q. Is that something that you would employ as a safe  
14 practice?

15 A. Yeah.

16 Q. Okay.

17 A. Trying to stay right on the surface of the lymph  
18 node so once you've identified the superficial  
19 surface, stick close to it so that you don't  
20 unintentionally injure any surrounding tissue is a  
21 good strategy.

22 Q. And speaking of that, one of the goals of the  
23 surgery would be to preserve the tissues around  
24 the lymph node as best as possible; correct?

25 A. Exactly.

1 Q. And in terms of the posterior triangle, that's the  
2 area where the surgery's taking place; correct?

3 A. Um-hum.

4 Q. Oh, by the way you have to say "yes" as opposed  
5 to "um-hum."

6 A. Sorry. Yes. Thank you.

7 Q. In terms of that area, the posterior triangle, the  
8 only vital structure that runs through there would  
9 be the spinal accessory nerve; correct?

10 A. Yeah, you could say that. I mean, there's some  
11 pretty significant-sized blood vessels that run  
12 through there, and there's some nerves that run  
13 deep to that, but for all intents and purposes,  
14 the spinal accessory nerve is the major structure  
15 that you want to try to preserve.

16 Q. And I further understand that when doing this  
17 procedure, one of the techniques that you would  
18 use would be to place a suture in the lymph node  
19 itself to assist you in teasing it away or pulling  
20 it away from the surrounding tissues. Is that  
21 something that you do?

22 A. No, I usually don't do that.

23 Q. Okay.

24 A. My experience is the lymph node is too friable,  
25 and sticking a suture in there, you would just

1 pull the suture out, so you might have to use a  
2 gentle forceps, which is a grasping tool, or blunt  
3 dissection, which means small pieces of gauze  
4 wrapped around your finger, or other real blunt  
5 dissecting techniques.

6 Q. Okay. Now, in terms of achieving hemostasis after  
7 the lymph node's been removed, it's my  
8 understanding that typically you can do that  
9 simply by putting pressure on the area where the  
10 vessels are bleeding at. Is that your  
11 experience?

12 A. That's reasonable, very reasonable, yeah.

13 Q. Okay, and I further understand that if you do have  
14 excessive bleeding you can control that through  
15 the use of sutures right on the bleeding vessel;  
16 correct?

17 A. That's an option, yes.

18 Q. And the other option would be the use of  
19 electrocautery; correct?

20 A. Right.

21 Q. Now, of the three options, is the electrocautery  
22 the most, for lack of a better word, the most  
23 dangerous, or it carries the most risk; would you  
24 agree with that?

25 A. Yeah, I think that's reasonable to say.

1 Q. Now, in your experience in the 50 or so cervical  
2 lymph nodes that you have dissected, have you had  
3 occasion to use electrocautery?

4 A. Yes.

5 Q. And under what circumstances would you use it?

6 A. Failure of those other prior two ways to control  
7 bleeding, either pressure or suture.

8 Q. So let's say in your note, would it say something  
9 to the effect that uncontrolled bleeding or  
10 excessive bleeding, or bleeding not being able to  
11 be or not able to be controlled with pressure or  
12 sutures, and therefore, electrocautery was used?

13 A. Right.

14 Q. Okay.

15 A. I would typically say, yeah, excessive bleeding or  
16 was controlled with cautery.

17 Q. So you would spare the use of electrocautery in a  
18 case where there was mild or easily-controlled  
19 bleeding?

20 A. Right, and that's a judgment sort of a thing,  
21 depending on how big the lymph node is. Ideally  
22 you try to do this without putting a little drain  
23 in, and that's why you want it reasonably dry.

24 Q. Okay.

25 A. And so there's some focus on keeping things dry.

1 Q. Yeah, I would be.

2 A. It's pretty dry stuff.

3 Q. I'm a pretty dry guy, so maybe I'll like it. Now,  
4 we can certainly agree, then, that in this case  
5 we're not talking about radical neck surgery;  
6 correct?

7 A. Right.

8 Q. And Doctor, in terms of your medical-legal  
9 involvement, again dealing with cases where you've  
10 been asked by one party or the other to render  
11 opinions or review records involving medical care,  
12 in other words, like a medical-negligence action,  
13 have you looked at cases or testified in cases  
14 involving medical care in the past?

15 A. Yes.

16 Q. And how many times would you say you've looked at  
17 records on behalf of lawyers in a medical case?

18 A. One or two.

19 Q. And have those been always where you've been asked  
20 on behalf of the lawyer representing the doctor to  
21 look at records?

22 A. No.

23 Q. Have you looked at records on behalf of a patient  
24 or a patient's lawyer?

25 A. Actually, I did. I actually worked with Howard

1 Mishkind on some case.

2 Q. That was actually, I think, was it a car accident  
3 case?

4 A. Right.

5 Q. But in terms of cases where a doctor's care of a  
6 patient is called into question --

7 A. Yeah.

8 Q. -- have you ever looked at records on behalf of a  
9 lawyer who's representing the patient?

10 A. I don't think.

11 Q. And on the occasions, a couple of occasions where  
12 you've looked at records on behalf of the attorney  
13 representing the defendants, do you remember who  
14 the defense lawyers were that you assisted or  
15 looked at records on behalf of?

16 A. Besides what I mentioned?

17 Q. Right.

18 A. I've done some looking at insurance -- on behalf  
19 of state insurance companies; just a couple.

20 Q. Okay.

21 A. That's about it.

22 Q. Have you done any work with Ms. Mitchell or  
23 Mr. Auciello, either of them or their law firm in  
24 the past, Gallagher Sharp?

25 A. Never.

1 Q. Do you know how they got your name in this case?

2 A. I don't.

3 Q. Have you actually testified in what we call a  
4 deposition; that's this setting here, where one  
5 lawyer asks you questions and a court reporter  
6 takes down your answers?

7 A. Once.

8 Q. Was that with Mr. Mishkind?

9 A. Twice.

10 Q. Okay; and what was the second one?

11 A. I was involved in a suit where someone was -- a  
12 lawsuit against me.

13 Q. And what was generally the facts that were  
14 involved in that case?

15 A. The facts were, there was an elderly woman who  
16 ultimately had an unrecognized esophageal  
17 perforation following a procedure.

18 Q. And was that case ultimately dismissed?

19 A. It was -- it went to mediation, and it was  
20 settled.

21 Q. Besides your medical practice and a couple of case  
22 that you've looked at in the past couple of years,  
23 do you do any, do you have any other professional  
24 activities?

25 A. No. Do you mean, do I do anything outside of what

1 is apparent here to use my medical degree or  
2 whatever?

3 Q. Yes.

4 A. No, none.

5 Q. You note in your CV that you had some dealings  
6 with Dr. Shuck at UH. Are you familiar with  
7 Dr. Shuck's opinions regarding medical negligence  
8 and his sort of negative philosophy about lawyers  
9 and lawsuits and that sort of thing?

10 A. No, I'm not.

11 Q. Okay.

12 A. I was -- the only reason I had any dealings with  
13 him is when I did my general surgery year, which  
14 is an internship year, he happened to be the  
15 chairman of the department.

16 Q. Right.

17 A. We all avoided him as much as we could.

18 Q. Doctor, I assume your medical license has never  
19 been restricted, revoked, suspended or called into  
20 question in any way; correct?

21 A. Correct.

22 Q. And I also assume that your staff privileges at  
23 any hospital have not been restricted, suspended,  
24 revoked or called into question in any way. True?

25 A. True.

1 Q. Would you agree that if proper care is taken in  
2 dissecting an inflamed lymph node that is  
3 non-cancerous and doesn't have any other pathology  
4 attached to it, like cat-scratch fever, that being  
5 careful, you can avoid injury to the spinal  
6 accessory nerve?

7 A. Yeah, I think that's usually how it works out. I  
8 agree.

9 Q. Do you have any plans to do any research relative  
10 to the facts of this case?

11 A. None.

12 Q. Let's talk about the injury involved here. First  
13 of all, can we agree that a healthy shoulder with  
14 proper enervation has a dynamic equilibrium of  
15 muscle forces that keep the shoulder in place?

16 A. Yes.

17 Q. And that when there is injury to the spinal  
18 accessory nerve, that dynamic equilibrium of  
19 muscle forces it, or that dynamic equilibrium is  
20 disrupted?

21 A. Potentially.

22 Q. It's my understanding that normally, the spinal  
23 accessory nerve is the sole nerve enervating the  
24 trapezius muscle?

25 A. True; it's my understanding.

1 Q. And that one of the features of injury to the  
2 spinal accessory nerve is pain; would you agree  
3 with that?

4 A. I'd have to check on that.

5 Q. Okay.

6 A. I thought it's mainly a motor nerve, not  
7 necessarily sensory, so I'd have to see.

8 Q. Yes, I agree with that, and I should clarify my  
9 question, but that when the motor function of the  
10 trapezius muscle is affected through injury to the  
11 spinal accessory nerve, that disruption of this  
12 balance of muscles around the shoulder can lead to  
13 a pain syndrome?

14 A. I think that's my understanding.

15 Q. All right. Do you have any opinions with regard  
16 to the prognosis for this patient currently?

17 A. As it relates to recovery of nerve function or  
18 trapezius muscle function?

19 Q. Right.

20 A. Well, there were some nerve studies that  
21 Ms. Formick had undergone which, to the best of my  
22 interpretation, show that there was a partial  
23 injury of that 11th cranial nerve.

24 And I'd have to retest the rechecking,  
25 which I believe was recently done, but it did show

1           that there was improvement in the functioning of  
2           the nerve. Again, the actual -- I'll have to rely  
3           on the interpretation by the neurologists.

4       Q. Right. Assuming that to be the case, would you  
5           anticipate that she has any permanent injury as a  
6           result of this initial problem that she had?

7       A. Well, I would -- she could possibly have some  
8           permanent injury. I think the fact that there has  
9           been some improvement is encouraging, and the  
10          ultimate, final outcome may be seen in the future.

11      Q. Sitting here today, you don't have an opinion to a  
12          reasonable degree of medical probability as to  
13          what her future holds, do you?

14      A. In terms of ability to move her arm?

15      Q. Correct.

16      A. Or raise her arm above 90 degrees? Yeah. I don't  
17          have; I don't have a specific opinion as to the  
18          amount of function that she will regain.

19      Q. If, in fact, Ms. Formick did have disability or  
20          pain associated with the injury to the spinal  
21          accessory nerve in the immediate postoperative  
22          period, could we agree, then, that the infection  
23          was probably not the cause of her spinal accessory  
24          nerve injury?

25      A. Okay; I'm sorry, can you repeat it? I was

1           distracted.

2           Q.   Sure; fair enough.  If you were to assume that, in  
3               fact, her problems with pain and dysfunction in  
4               the shoulder occurred immediately in the  
5               postoperative period, could we then agree that the  
6               injury to the spinal accessory nerve was not  
7               caused by the infection?

8           A.   My interpretation of what you're asking me is if  
9               she woke up in the recovery room or that night or  
10              the next day and called and said, "Look, I got  
11              this problem.  I can't raise my arm," then in my  
12              mind, there was an intraoperative injury to the  
13              nerve.

14          Q.   And in terms of in the postoperative period, she  
15               was on, she was prescribed, I believe Tylenol 3's;  
16               I think that's right.  What is Tylenol 3, by the  
17               way?

18          A.   Tylenol 3 is a combination of codeine and  
19               acetaminophen that is commonly used in the  
20               immediate postoperative period.

21          Q.   So would that have an effect of being both a  
22               sedative and a pain reliever?

23          A.   The shouldn't have much sedative effect.  It  
24               should mainly be a pain reliever.

25          Q.   Okay.

1 A. Analgesic.

2 Q. And following this procedure, would you expect  
3 there to be some discomfort in the neck area that  
4 would be a natural part of the surgery itself?

5 A. I would expect a day or two of pain that would  
6 require a narcotic to help get a person through  
7 that period.

8 Q. Now, if a patient does experience some compromise  
9 of the spinal accessory nerve but not total  
10 compromise of the spinal accessory nerve  
11 intraoperatively as a result of one of these  
12 surgeries, what would you expect the postoperative  
13 course to be like?

14 A. In my mind, some of it would depend on the  
15 mechanism of injury; then there's potential  
16 options in terms of a little bit of crush.

17 Q. Right.

18 A. Where you would immediately notice some  
19 impairment, but if there wasn't too much damage,  
20 you would get progressive improvement of the  
21 functioning of the nerve.

22 Q. Okay.

23 A. The scenario that we're kind of looking at, where  
24 initially her arm was all right, but then a day or  
25 two later she started to notice drainage and pain,

1 which again is an infection, that shows a  
2 different time course.

3 But again, I would expect improvement  
4 spontaneously after the infection was controlled.  
5 Is that sort of along the lines of what you're  
6 asking me?

7 Q. Yes, but if, in fact, the nerve was lacerated  
8 intraoperatively -- not completely cut in half,  
9 but lacerated -- what sort of postoperative course  
10 would you expect?

11 A. Well, I would expect immediate, partial paralysis,  
12 paresis.

13 Q. And what would you expect if the nerve was burnt  
14 through with electrocautery; what would you expect  
15 postoperatively?

16 A. Well, then I would expect a scenario similar to  
17 being cut, where there would be immediate  
18 inability for the nerve to function.

19 Q. Okay.

20 A. But depending on the level of burn, progressive  
21 improvement.

22 Q. And in terms of the patient recognizing this  
23 immediate paralysis, there would not be a loss of  
24 sensory function in the trapezius; correct?

25 A. Usually. I would say no, yes.

1 Q. So in other words, the patient wouldn't feel a  
2 paresthesia or anything; right?

3 A. Numbness, right.

4 Q. Okay, and they wouldn't feel pain either, would  
5 they?

6 A. Immediately?

7 Q. Right.

8 A. Nothing more than associated with the incision.

9 Q. Now, are you familiar with any of the risks  
10 associated with injury, the long-term  
11 complications associated with spinal accessory  
12 nerve injury?

13 A. Only in very general terms. I don't deal with it  
14 routinely.

15 Q. Would you agree that one of the long-term risks  
16 associated with spinal accessory nerve or  
17 complications associated with it would include  
18 thoracic outlet syndrome?

19 A. No, I'd have to defer to a neurologist or somebody  
20 who has more experience.

21 Q. Well, let me ask it this way: What's your  
22 understanding of what would be the potential  
23 complications or risks of spinal accessory nerve  
24 injury over a long period of time?

25 A. Well, you would have an inability to raise the

1 arm; pain, as we sort of alluded to earlier;  
2 there's an asymmetry of the shoulder girdle, based  
3 on the -- the name of the bone is slipping my mind  
4 now, but the bone, the bone sort of cants out and  
5 becomes bat-winged.

6 Q.. The scapula?

7 A. The scapula, thank you -- on that side, long-term;  
8 secondary, to the best I know, loss of tone of the  
9 trapezius.

10 Q. Besides being able to do overhead work, have you  
11 heard of complications associated with spinal  
12 accessory nerve injury that make it difficult to  
13 do activities that involve forward extension such  
14 as cutting meat, driving, or writing?

15 A. That may be. Again, because I haven't really  
16 delved into it, I would feel uncomfortable saying  
17 one way or the other.

18 Q. Doctor, do you agree that the follow-up care that  
19 Mrs. Formick has received has been appropriate; in  
20 other words, are you critical of any of the  
21 surgeons or physicians that treated her after she  
22 discovered that she had this injury?

23 A. No. She was started on an antibiotic  
24 expeditiously orally, and a cream to apply to the  
25 area.

1 Q. Okay.

2 A. So in terms of controlling the infection, I think  
3 that was a real reasonable thing to do.

4 Q. How about in terms of going to see a neurologist,  
5 going to see Dr. Hardy? And I think that's about  
6 all that she did in terms of when she learned that  
7 she had damage to her spinal accessory nerve;  
8 that's pretty much what she did.

9 Were the actions of Dr. Mann, the  
10 neurologist, and Dr. Hardy, the surgeon, were they  
11 appropriate and reasonable, in your opinion?

12 A. Yeah, I think they were very appropriate.

13 Q. Okay.

14 A. She also went to see a -- went to see  
15 Dr. Esclamado, which is a second opinion,  
16 somewhere along those lines. Yeah, that's exactly  
17 what I would have done if this happened to me.

18 Q. And his care was appropriate under the  
19 circumstances?

20 A. I think so.

21 Q. And Tricia's follow-up in terms of trying to get  
22 this repaired and going to Dr. Esclamado and  
23 Dr. Mann was appropriate?

24 A. I think so, yes.

25 Q. Are you critical of her in any respect with regard

1 to her follow-up of this condition?

2 A. Not at all. I'm sure it's very frustrating for  
3 her to have that kind of difficulty, given what  
4 she does for a living.

5 Q. Yes. Now, Doctor, assuming that Ms. Formick does  
6 have a pain syndrome associated with her spinal  
7 accessory nerve injury, first of all, would that  
8 type of presentation be consistent with this  
9 injury; in other words, a pain syndrome?

10 A. Yeah, I'd have to refer to my neurology  
11 colleagues.

12 Q. And here she is now about five years postop.  
13 Would you expect that if she does have a pain  
14 syndrome associated with this injury, that it  
15 would be permanent in nature?

16 A. Again, I'd just have to refer to them.

17 Q. Okay.

18 A. I couldn't really give you a good, informed  
19 opinion about that.

20 Q. Are you aware of any treatments that were  
21 available to --

22 A. She's about four years out, excuse me.

23 Q. Fair enough. Are you aware of any treatments  
24 available to her that may improve her condition or  
25 that she hasn't tried yet that may assist her in

1 recovering from this injury?

2 A. Again, I think that's more the realm of the  
3 neurologist. In terms of exercises, things along  
4 those lines?

5 Q. Surgeries, exercises, anything.

6 A. Part of the problem that I see is there is a --  
7 and it's not a problem; it's fortunate that she  
8 does have some re-ennervation, and that's  
9 encouraging.

10 And the last study that she had, which  
11 looks like it was March of 2002, by Dr. Katirji,  
12 shows that she had significant re-ennervation with  
13 marked improvement of the right spinal accessory  
14 neuropathy, which is sort of an encouraging thing;  
15 and I don't know -- I would again have to defer to  
16 them whether there's any value to retesting her  
17 now a year, year and a half after that.

18 Q. In general, can we agree that EMGs do have their  
19 limitations?

20 A. Again, I'm going to have to defer to one of the  
21 neurologists.

22 MR. KULWICKI: I think that's all the  
23 questions I have. Why don't you give me a few  
24 minutes to confer with my co-counsel and we'll  
25 come back and wrap up.

1 THE WITNESS: Sure.

2 Q. I know what we should do -- why don't we mark your  
3 report as Exhibit 2, and if you could, just for  
4 the record, identify this report; in other words,  
5 confirm that it is, indeed, your report in this  
6 case.

7 (Plaintiff's Deposition Exhibit No. 1,  
8 Curriculum Vitae of Edward Fine, M.D., Ph.D., and  
9 Plaintiff's Deposition Exhibit No. 2, Dr. Fine's  
10 report of May 20, 2003, marked for  
11 identification.)

12 Q. I'll give you that, Exhibit 2.

13 A. Yeah, I think that's mine.

14 Q. Have you prepared any other reports or drafts of  
15 this report?

16 A. No.

17 Q. Do you have any notes relative to your  
18 investigation into this case?

19 A. Just what you've sent to me.

20 Q. Okay, very good. Doctor, one of the things in a  
21 medical negligence case that you may be asked to  
22 opine about is what the standard of care is, or  
23 what you consider to be the standard of care in  
24 this case. How do you define that term, standard  
25 of care?

1 A. I may be able to opine?

2 Q. Yes. Opine, give opinions?

3 A. Oh, opine. Do I think this is standard of care?

4 Q. No, what I was asking you to do is define  
5 "standard of care."

6 A. Define the term "standard of care"?

7 Q. How do you define that?

8 A. In my mind, that's something that going to a, I'll  
9 say community-based physician, you would have the  
10 expectations of having a certain level of  
11 treatment provided.

12 And by a certain level, I mean,  
13 aggressiveness, work-up, things they usually do  
14 that usually go into a normal interaction with a  
15 patient.

16 Q. So I guess maybe to clarify, are you saying that  
17 it's what you would expect a physician in a  
18 particular community to do in terms of evaluation  
19 or treatment of a particular patient?

20 A. Yeah, that's a good summary.

21 Q. Have you had a chance to read Dr. Barnes'  
22 deposition?

23 A. I did.

24 Q. And other than the basic opinion about what caused  
25 this spinal accessory nerve injury, do you have

1 any other specific areas of disagreement with  
2 Dr. Barnes?

3 MS. MITCHELL: Dave, can I interject for a  
4 second -- I think the doctor thought you were  
5 referring to the report.

6 MR. KULWICKI: Oh, okay. All right.

7 Q. So you've read his written report, but not his  
8 deposition transcript?

9 A. Right.

10 Q. Okay.

11 A. Yes.

12 Q. And again, in terms of differences between you and  
13 Dr. Barnes, the obvious one is that Dr. Barnes  
14 feels that this was an intraoperative injury, and  
15 you feel that it was as a result of the infection,

16 A. Yes.

17 Q. But other than that difference, are there any  
18 other areas that you differ with Dr. Barnes as far  
19 as his report is concerned?

20 A. Well, I don't necessarily agree with a lot of the  
21 stuff he put in this report; and, you know, I  
22 don't know how detailed we want to get.

23 Q. Did you make any notes, by any chance, on his  
24 report?

25 A. I did make some notes, yeah.

1 Q. If I could just ask you about those?

2 A. Sure. Do you want a copy of that?

3 Q. Well, why don't you just run through it?

4 MS. MITCHELL: May I see it when you're  
5 done?

6 MR. KULWICKI: Sure.

7 Q. Why don't you just run through your notes and just  
8 tell me what you've written.

9 A. Okay. Well, I wrote -- paragraph by paragraph?

10 Q. Why don't we start with right here? You have a  
11 question mark, and you say "not at all." Can you  
12 just tell me what you were thinking when you wrote  
13 that?

14 MS. MITCHELL: That's at the bottom of the  
15 second paragraph?

16 MR. KULWICKI: Correct, yes.

17 A. Well, I had a question after that. I just wonder  
18 how well -- here he indicates that from the  
19 records -- this is my understanding -- that he  
20 gleaned that she could not move the arm.

21 Q. And you didn't think that was quite --

22 A. Well, no. My question to him would be, could she  
23 not move it at all; okay?

24 Q. Oh, okay.

25 A. Okay? And that's a much different scenario than

1           what we're talking about.

2       Q.   Okay.

3       A.   I mean, all this is in the left neck.  Minor  
4           stuff, but --

5       Q.   So he had the wrong side of the neck in his  
6           report?

7       A.   He's got the wrong side of the neck throughout  
8           this.  He indicated that things were pretty  
9           prominent, but the lymph node is barely a  
10          half-inch in size, and so -- one centimeter by one  
11          centimeter by one and a half.

12                So again, they're just minor things.  It's  
13          just when I look at this, I'm just trying to sort  
14          of figure out what he's talking about.

15       Q.   Incidentally, a centimeter would be about, what --  
16           the size of a dime or something?  Is that what  
17           we're talking about; maybe a little smaller?

18       A.   Probably a little smaller.  I usually have a ruler  
19           here.

20       Q.   That's all right.  You don't have to give it  
21           exactly.

22       A.   A little less than half an inch.

23       Q.   Okay.  All right; and then at the bottom of the  
24           page, you have some writing here.  Can you just  
25           run through that briefly and tell me what you

1 wrote?

2 A. Sure. Well, there's no mention of  
3 postoperatively, I didn't see where she was seen  
4 by Dr. Rosenberg.

5 Her surgery, I believe, was done -- and let  
6 me get these correct -- let me figure out the  
7 specific date -- I'm sorry -- that this was done;  
8 the 16th of November. I'm sorry, it looks like  
9 October 20th.

10 Q. I believe October 20th was the date of surgery.  
11 Okay, so he got the date of surgery wrong in his  
12 report?

13 A. Let me be sure. I'm sorry I'm not better  
14 organized. Do you have a copy of that operative  
15 note?

16 Q. The op note? It's really not that important,  
17 Doctor. I think, in fact, he did get it wrong in  
18 his report, and corrected it in his deposition.

19 But just really for our purposes, I'm just  
20 trying to understand what your notes say here, so  
21 it's really not important for us to clarify that.  
22 I can find it if you really want to see it.

23 A. The op note?

24 Q. Yes.

25 A. Sure.

1 Q. In terms of when you give your patients  
2 antibiotics postoperatively for this particular  
3 procedure, have you had any problems with them  
4 developing infections?

5 A. I've had more problems with them developing upset  
6 stomachs. That isn't uncommon. To answer your  
7 question -- I'm sorry -- I haven't had any  
8 difficulty with infection, but that's my own  
9 particular -- how I was trained.

10 MR. KULWICKI: Why don't we take a quick  
11 break, and I think I may be done.

12 THE WITNESS: Of course.

13 (A short recess was held.)

14 MR. KULWICKI: Let's just wrap up here.

15 Q. Doctor, when we first began the deposition, you  
16 had mentioned something about operative scarring  
17 and how that may have affected the outcome.

18 And I don't want to put words in your  
19 mouth, but you mentioned something about her not  
20 having normal tissue planes or something. Tell me  
21 what you meant by that.

22 A. Usually if you enter a virgin neck, native neck,  
23 one that hasn't been operated on, all the paths or  
24 planes that divide the muscles from the overlying  
25 soft tissue or muscles from each other are easily

1 spread apart, usually with just a finger, or what  
2 I would call bluntly.

3 If somebody has entered the neck for  
4 whatever reason, then there's sort of the natural  
5 body's response to heal, and with that you get  
6 some scarring; and that can cause adhesions or  
7 sort of attachment of these normally unattached  
8 muscles or tissues together.

9 Q. So if she had surgery in the same area as this  
10 surgery that we're talking about here, that might  
11 have made it more difficult to do the dissection;  
12 is that what you're saying?

13 A. Yeah, I think it would, definitely.

14 MR. KULWICKI: Okay. That's all the  
15 questions I have, and you have the right to review  
16 the transcript; and Ms. Mitchell may, or  
17 Mrs. Mitchell may have some advice for you in that  
18 regard.

19 MS. MITCHELL: I know you've only been  
20 deposed twice before. You do have a right to  
21 review the transcript to make sure that your words  
22 were taken down accurately -- obviously, you can't  
23 make any changes to the testimony you've given --  
24 or you can trust the court reporter that she took  
25 everything down.

1           Since this was a fairly short deposition,  
2           it's a comfort level for you. I don't see any  
3           problems in waiving, but you're entitled to read.

4           THE WITNESS: Okay.

5           MS. MITCHELL: What would you like to do?

6           THE WITNESS: If I read, what does that  
7           mean? That means I get a copy of the transcript  
8           before?

9           MS. MITCHELL: Right. That means that the  
10          court reporter, who will most likely be providing  
11          an expedited transcript if possible, will forward  
12          a transcript within seven days of its preparation.

13          And since trial is next week, it would be a  
14          problem. You can read through it and correct any  
15          errors on what's called an errata sheet --

16          THE WITNESS: Yeah.

17          MS. MITCHELL: -- and then report that to  
18          me, and I'll return that to her. Really, it's  
19          your own comfort level. This wasn't --

20          THE WITNESS: Well, I guess I can waive  
21          this.

22          MS. MITCHELL: Okay. So just for the  
23          record, if you want to say you wish to waive  
24          signature?

25          THE WITNESS: For the record, I wish to

1 waive signature.

C E R T I F I C A T E

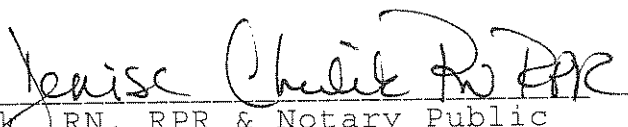

STATE OF OHIO,                   )  
                                      ) SS:  
SUMMIT COUNTY.                   )

I, Denise Chulik, a Registered Professional Reporter and Notary Public in and for the State of Ohio, duly commissioned and qualified, do hereby certify that the within-named Witness, **EDWARD FINE, M.D., Ph.D.**, was first duly sworn to testify the truth, the whole truth and nothing but the truth in the cause aforesaid; that the testimony so given by him was by me reduced to Stenotype in the presence of the witness, and that the foregoing is a true and correct transcription of the testimony so given by him as aforesaid.

I certify that this deposition was taken at the time and place in the foregoing caption specified.

I certify that I am not a relative of, employee of or attorney for any of the parties in the above-captioned action, that I am not a relative of or employee of an attorney of any of the parties in the above-captioned action, that I am not financially interested in this action, and that I am not, nor is the court-reporting firm with which I am affiliated, under a contract as defined in Civil Rule 28 (D).

IN WITNESS WHEREOF, I have hereunto set my hand and affixed my seal of office at Akron, Ohio, on this 10th day of July, 2003.
