Case No. 88-3453

11 GRANDVIEW HOSPITAL &)
12 MEDICAL CENTER, et al.,)
13 Defendants.)

14 - - -

15 Deposition of BRUCE DAVID JANIAK, M.D., a
16 Witness herein, called by the Plaintiff as if upon
17 Cross Examination under the Ohio Rules of Civil
18 Procedure, taken before me, the undersigned, Jane
19 Beckett, a Notary Public in and for the State of
20 Ohio, pursuant to Notice and agreement of Counsel
21 as hereinafter set forth, at the Toledo Hospital,
22 Toledo, Ohio, on Monday, September 18, 1989,
23 commencing at 2 o'clock p.m.

- - -

1 APPEARANCES:

2 On behalf of the Plaintiff:

3 ROGER B. TURRELL & ASSOCIATES:
4 Valerie Stocklin
James D. Cole5 On behalf of Defendant TMES, Inc. & Dr.
6 Myers:

7 Robert F. Cowdrey

8 On behalf of Defendant Dr. Rank:

9 BIESER, GREER & LANDIS:
Howard P. Krisher

10 On behalf of Defendant Dr. Keighley:

11 MILLER, FINNEY & CLARK:
Jerome G. Menz12 - - -
13 BRUCE DAVID JANIAC, M.D.,14 a Witness herein, after having been first duly
15 sworn, was deposed and testified as follows:16 MS. STOCKLIN: Dr. Janiak, we
17 have met before.

18 THE WITNESS: Yes, ma'am.

19 MS. STOCKLIN: My name is Valerie
20 Stocklin. I'm here on behalf of
21 the Jesse B. Weaver family on this
22 case. We're meeting her pursuant
23 to the Ohio Civil Rules of

1 Procedure as well as agreement of
2 Counsel with your convenience, and
3 Notice.

4 Can we stipulate to the
5 qualifications of the Court
6 Reporter?

7 MR. COWDREY: Certainly.

8 - - -

9 CROSS EXAMINATION

10 BY MS. STOCKLIN:

11 Q. Would you, Doctor, please state your full
12 name and address?

13 A. Bruce David Janiak. Home address is 30267
14 Hickory Hill Drive, Perrysburg, Ohio,
15 43551. Do you want the professional
16 hospital address too?

17 Q. Yes, please.

18 A. It's the Toledo Hospital, 2142 North Cove,
19 C-o-v-e Boulevard, 43606.

20 Q. Thank you.

21 MS. STOCKLIN: Would you mark
22 this, please?

23 (Plaintiff's Deposition Exhibit No.

1 1 was marked by the Court Reporter
2 for purposes of identification.)

3 Q. Dr. Janiak, I was previously supplied by
4 Mr. Cowdrey, or by you I believe, a copy of
5 your curriculum vitae. I've had that
6 marked as Exhibit 1 in this deposition, and
7 I wondered if you would tell me if that is
8 your most recent up-to-date curriculum
9 vitae, please?

10 A. Yes, but I need to make another one because
11 there are two additional items that have
12 happened since this was -- since we printed
13 this one.

14 Q. And are those items personal or
15 professional?

16 A. They are professional. One is an award and
17 one is a new position.

18 Q. Would you like to tell me about those?

19 A. The award is the Wiegenstein Award which is
20 given by the American College of Emergency
21 Physicians. I received that just last week
22 in Washington. And the position is the
23 position of President-elect of the American

1 Board of Emergency Medicine.

2 Q. So then you will be President of that Board
3 for one year starting from now?

4 A. For one year starting in June of '90.

5 Q. Any other additions or changes?

6 A. No, I think that's it.

7 Q. All right, Doctor, we have had an
8 opportunity before to discuss your -- you
9 can hold onto this if you need it to refer
10 to anything -- we have discussed before
11 your education and training in the field of
12 medicine, and specifically emergency
13 medicine. So I don't want to go into a
14 whole lot of detail about that, but I would
15 like to ask you a couple of specific
16 questions.

17 My understanding is, Doctor, that
18 you have been the Director of the
19 Department of Emergency Medicine here at
20 Toledo Hospital since 1974; is that
21 correct?

22 A. That is correct.

23 Q. And you completed your training in -- or

1 your residency in emergency medicine in
2 1972; is that correct?

3 A. That is also correct.

4 Q. And in between those two dates, you were in
5 the Navy?

6 A. That's right.

7 Q. And what did you do in the Navy?

8 A. I was Director of the Naval Hospital
9 Emergency Department in Pensacola, Florida
10 Naval Hospital.

11 Q. It's my understanding, Dr. Janiak, that
12 your specialty training in medicine and
13 education is limited to the specialty of
14 emergency medicine; is that correct?

15 A. That's right.

16 Q. You have not had any specific training in
17 any other areas of medicine?

18 A. That's correct.

19 Q. Doctor, directing you to your last page of
20 your curriculum vitae, under miscellaneous,
21 you are listed as the President of EMB
22 Professionals, Inc.?

23 A. Correct.

1 Q. Is that the case today?

2 A. Yes, it is.

3 Q. All right, so that's a current thing?

4 A. Yes.

5 Q. What is EMB Professionals, Inc.?

6 A. It's a billing company which specializes in
7 billing for emergency medicine physicians.

8 Q. And that is a corporation?

9 A. Right.

10 Q. And am I correct in my understanding that
11 there are three shareholders or owners of
12 that corporation?

13 A. You are correct.

14 Q. And that's yourself and Dr. Michael Irvin?

15 A. Right.

16 Q. And a Marty Gillespie?

17 A. That's right.

18 Q. And you are the President of that. Does
19 that corporation enter into contracts with
20 various hospitals or emergency groups, or
21 tell me how that works?

22 A. Well, normally we enter into a contract
23 with an emergency group, although we could

1 enter into a contract with a hospital also
2 to do the billing. Currently all our
3 contracts are with the group of emergency
4 physicians at particular hospitals.

5 Q. So this would be a group outside of your
6 emergency group, a completely different
7 group, and you enter into a contract to
8 handle their billing for them?

9 A. That's correct, although my emergency group
10 is also one of the groups that has a
11 contract to have the billing done by this
12 company.

13 Q. Are the three shareholders of this
14 corporation, Dr. Janiak, equal
15 shareholders?

16 A. No.

17 Q. Are you the majority shareholder?

18 A. No, Dr. Irvin and I are 40 percent, and
19 Mrs. Gillespie is 20 percent.

20 Q. As President and one of the major
21 shareholders of that corporation, Dr.
22 Janiak, what are your duties? What do you
23 do?

1 A. Well, our basic duty has been to look for
2 new business by utilizing our contacts. By
3 our, I mean Dr. Irvin's and my contacts
4 throughout the State of Ohio and in other
5 states.

6 We also obviously are responsible
7 for making sure that the business is run
8 appropriately, that the decisions are made
9 regarding growth or no growth, advertising
10 or no advertising, typical business kind of
11 decisions that would be made. Currently
12 for instance we're deciding whether or not
13 we should purchase a new computer system.
14 So those are the kinds of duties that we
15 would have as officers and shareholders.

16 Q. Is there a home office for this
17 corporation?

18 A. Yes.

19 Q. Is that in Dayton, Ohio?

20 A. Yes, ma'am.

21 Q. How much traveling if any, Doctor, do you
22 do to Dayton, Ohio in regard to this
23 particular corporation or business?

1 A. Well, it varies with the amount of need we
2 see to meet. The first six months of this
3 year I went to Dayton once. The last two
4 months I've been there three times. So
5 each time would be spending a day of work.

6 Q. And how does your corporation charge an
7 emergency group for this service? Is it a
8 flat yearly rate or a percentage of billing
9 or what?

10 A. It's either percentage or per chart charge.
11 So it's either based on a percentage of
12 billed or based on the volume that a
13 patient is seen by the emergency physicians
14 and whichever method is more comfortable
15 for our clients, we'll bill them that way.

16 Q. All right. Does this corporation, EMB
17 Professionals, Inc., have any other
18 function other than billing services for
19 emergency groups?

20 A. No.

21 Q. How much time, Dr. Janiak, would you say
22 you devote to this particular corporation
23 or business endeavor?

1 A. Well, so far this year it's been four days,
2 plus I would say six phone calls of less
3 than 10 minutes each so far this year.

4 Q. All right, so there are not any weekly or
5 monthly duties or functions that you serve?

6 A. No, there are not.

7 Q. All right. Now, you are also -- correct me
8 if I am wrong, okay, but my understanding
9 is that you are also the sole owner and
10 shareholder of Professional Emergency
11 Services, Inc.?

12 A. Correct.

13 Q. And this is your corporation which provides
14 the emergency services for this particular
15 hospital, Toledo Hospital?

16 A. Correct.

17 Q. Was that corporation formed, Doctor, when
18 you became the Director of Emergency
19 Services here?

20 A. Yes.

21 Q. And do you still employ six full-time
22 emergency physicians?

23 A. In addition to myself, yes.

1 Q. And also some part-time physicians?

2 A. Correct.

3 Q. Are those all pediatricians?

4 A. No. We've added approximately four to five
5 more emergency physicians in addition to
6 the pediatricians.

7 Q. On a part-time basis?

8 A. On a part-time basis.

9 Q. All these physicians then are employees,
10 direct employees of the Professional
11 Emergency Services, Inc.?

12 A. Right.

13 Q. And how are your full-time emergency --

14 A. Well, let me correct that. That is not
15 exactly correct. There are a couple of
16 them who wish to be dealt with as
17 independent contractors rather than
18 employees, and so obviously they would
19 receive their checks without the usual
20 withholding taken out.

21 Q. And then they're compensated on a per day
22 or per hour basis?

23 A. Per hour basis.

1 Q. All right, how about the other full-time
2 physicians who are employees of this
3 corporation, how are they compensated?

4 A. They are all compensated on an hourly
5 basis.

6 Q. Do these physicians have a set number of
7 hours that they work in the emergency room
8 here at Toledo Hospital per week?

9 A. Yes. There is a basic schedule which is
10 made out months in advance and they are
11 asked to adhere to that schedule.

12 Obviously there are things in life that
13 make you change a schedule and they can
14 switch whenever they so desire.

15 Q. All right, how many hours per week is each
16 full-time physician allotted in the
17 emergency room?

18 A. Well, they work 64 hours every 14 days,
19 basic work. So that is 32 hours a week,
20 and then they fill in for each other when
21 there are vacations or meeting time or
22 whatever else may be necessary, and that
23 amount I've never calculated, but it

1 probably is somewhere between eight and ten
2 extra hours in a week. But exactly what it
3 is, I don't know.

4 Q. And how about your part-time emergency
5 physicians?

6 A. They are asked to work on a variable basis
7 between 6 o'clock in the evening and
8 midnight, and we've been doing that now
9 only for a month and most of them would be
10 working certainly less than full time pro
11 rated schedule, but probably around 12
12 hours a month per doctor or something like
13 that.

14 Q. Is there 24-hour emergency physician
15 coverage in this emergency room?

16 A. Yes, there is.

17 Q. All supplied by this corporation?

18 A. That's correct.

19 Q. You also operate as an emergency physician
20 on a weekly or regular basis throughout
21 this emergency room, correct?

22 A. Correct.

23 Q. And are you also, Doctor, scheduled for 64

1 hours every 14 days?

2 A. No, I am not.

3 Q. What are you scheduled?

4 A. I'm not scheduled except on Tuesday
5 mornings. I have always worked Tuesday
6 mornings from 8 a.m. till noon. So what I
7 do is I work whenever we need backup and I
8 work whenever someone has a shift that
9 needs to be filled in.

10 Q. So other than the Tuesday morning, your
11 schedule is erratic or unpredictable?

12 A. Very erratic. Totally unpredictable. For
13 instance, I had no idea I'd be here most of
14 the day this last Saturday, but I was so --

15 Q. What did the weeks of August of this year,
16 Doctor, average for you as to hours in this
17 emergency room?

18 A. I have that written down. It was pretty
19 close to 26 hours a week I think actually
20 in the department seeing patients on my
21 own.

22 Q. During the month of August?

23 A. During the month of August.

1 Q. Would you say the month of August was
2 typical, busy or less than usually busy for
3 you personally?

4 A. For me personally, it was pretty typical
5 for the way things have been now in this
6 department.

7 Q. Doctor, is there any teaching involved with
8 your practice here at Toledo Hospital?

9 A. Almost every day.

10 Q. All right, how is that done?

11 A. Well, each individual physician has
12 residents with them when they're working so
13 there's teaching that's done then, but at
14 times when we're not working, we'll also do
15 teaching either by lecturing or by just
16 wandering over to the department and seeing
17 patients with residents.

18 So that would be hours in addition
19 to the 26 because there literally is never
20 a day when I am here when I don't go over
21 to the department and do that. So I'm
22 always spending some time, I don't mark it
23 down. But I would say that if you add that

1 up with the lectures and chart review and
2 other clinically oriented things, you'll
3 come out with another 20 hours.

4 Q. Are you scheduled for a certain number of
5 hours of lecturing per week?

6 A. No, there is no -- some of my lectures take
7 place here, so there's no schedule for that
8 except for two sets of -- I usually give
9 three sets of Grand Rounds a year, and that
10 is not -- but it's not scheduled, it's an
11 agreement to do that and what happens is
12 the residency director will call and ask if
13 I can give a Grand Rounds on a particular
14 day, and I tell them whether I can or I
15 can't.

16 But I wouldn't be able to tell you
17 what day it's scheduled for next, for
18 instance. I just don't know.

19 Q. So your teaching then I take it is not done
20 on every Tuesday and Thursday afternoon
21 from one to three basis?

22 A. That's right, you're exactly right, exactly
23 right.

1 Q. Let's talk about the other 20 hours per
2 week that you -- you said that that
3 consisted of what?

4 A. Well, some of it is just speaking with
5 residents. One of the things that has
6 taken up some time recently is working with
7 a resident about developing a fellowship,
8 so we spent a lot of time working on that
9 issue.

10 Others are just speaking with
11 residents about clinical issues. Whenever
12 I work, I review charts. And when I review
13 the charts, I will find documentation that
14 is not worded the way I would like it to,
15 as nearly 100 percent of the time prompts a
16 letter and a meeting with a resident, so I
17 do that every time I work is come across a
18 resident and say let's sit down and talk
19 about this case, this issue, why did you
20 write -- for instance, the last one was why
21 did you write down gastritis on a patient
22 that you gave Erythromycin to.

23 You don't give Erythromycin because

1 it irritates the stomach. So we have a
2 discussion about that one minor clinical
3 issue, and that happens -- I probably pick
4 up three of those every time I work,
5 something discussed with residents.

6 So there is that time, there is
7 chart review, which is done on an informal
8 basis whenever I'm in the building, and a
9 formal basis with peer review forms in
10 which we review on a more detailed level
11 the care given by all of the attending
12 physicians.

13 There is review of pediatricians'
14 records and recently I've taken on the task
15 of reviewing for clinical reasons the
16 charts of all of the new part-time
17 physicians in emergency medicine we talked
18 about earlier.

19 Q. This is a probationary period or something
20 to see how they're doing?

21 A. Right. And I'm responsible for making sure
22 their clinical care is appropriate so I
23 review all those too. So obviously all

1 this kind of review does take some time.

2 And then the other thing that
3 happens is it's not particularly unusual
4 for me to be sitting here reading those
5 things, and then they'll call me to the
6 department because it's busy and I'll see
7 patients. And that's been happening as I
8 said almost every day that I work. And why
9 we're that busy right now, I'm not sure,
10 but it's more likely than not that I'm over
11 there seeing patients each day.

12 Q. Who is responsible for the administration
13 and management of the activities of your
14 emergency group, Professional Emergency
15 Services, Inc.?

16 A. I am.

17 Q. You are?

18 A. Yes.

19 Q. How much time, Doctor, per week would you
20 say that management and administration
21 takes?

22 A. That's probably another 10 hours plus, 10,
23 15. It depends if it's routine financial

1 activities and all that is handled by my
2 wife. All the bookkeeping, the check
3 writing, making sure that we've paid our
4 taxes and all the things that one has to do
5 to keep it financially operating. I don't
6 deal with that.

7 If it has to do with making a
8 decision about a new benefit, then I would
9 do that. If it has to do with making sure
10 if one of the guys would ask me what the
11 reimbursement rate is for a meeting, then I
12 wouldn't answer that question.

13 So obviously most of the effort is
14 not towards actually running Professional
15 Emergency Services, but the administrative
16 effort is towards interacting with the
17 medical staff here at the hospital.

18 So as a representative of
19 Professional Emergency Services, if there
20 is a problem with patient care, either
21 because we have alleged to have done
22 something wrong or a problem that we have
23 with a resident or a physician on another

1 service, then all those issues become
2 issues that I have to handle on behalf of
3 the group.

4 (Mr. Menz arrives at the
5 deposition.)

6 A. To give you an idea of how much time it
7 takes, all of our nurses were particularly
8 unhappy with the behavioral characteristics
9 of a particular resident from another
10 service who was coming down to our
11 department and being rather nasty to every
12 single human being that he interacted with.
13 So that would require interviewing the
14 nurses, looking at all the records,
15 discussing the issue with the Director of
16 Medical Education for in this case the
17 Surgery Department, discussing with the
18 Director of Medical Education for Emergency
19 Medicine and the Hospital's Director of
20 Medical Education, and then making a
21 decision about what to do next, whether
22 that resident needed counseling or the
23 resident was doing something inappropriate

1 clinically, because you have to check that.

2 And then finally it culminates in a
3 letter where I indicate what our
4 department's position is. In this
5 particular case, our position was that that
6 resident wasn't allowed in our department
7 again, so in these kinds of things take --
8 that's where those 10 hours and sometimes
9 20, depending on which week it is, get
10 eaten up.

11 Q. Doctor, what is the policy or is there a
12 policy, or what do you do as far as
13 coverage in the emergency room here? Do
14 you always have one doctor covering more
15 than one, does it depend on the time of day
16 or what?

17 A. Right. There are two policies. Our
18 contract says we have to have at least one
19 physician present, however it's pretty easy
20 to realize with a department as busy as
21 ours that that wouldn't be adequate, so the
22 contract also says that it's my job to be
23 sure that the physician supply is adequate

1 to deliver reasonable patient care.

2 And so that means that we have to
3 make decisions on looking at statistics
4 which is another thing I have to do. What
5 are the busiest shifts and when do we need
6 coverage with two doctors, three doctors or
7 four doctors. So currently we have five
8 doctors in the evening on most evenings
9 because evening times are busier than the
10 middle of the day.

11 Q. You have five?

12 A. Yes.

13 Q. Are there times when you do just have one
14 doctor covering?

15 A. No.

16 Q. Always at least two?

17 A. Always at least two unless there's an
18 illness. There are always at least two
19 scheduled.

20 Q. And how many beds in this emergency room?

21 A. Twenty-four.

22 Q. You do not have a care flight or a
23 helicopter?

1 A. Not at this hospital.

2 Q. Does this hospital take charity or
3 noninsured patients?

4 A. Anybody that comes in.

5 Q. Dr. Janiak, you're familiar I'm sure with
6 JCAH accreditation for hospitals?

7 A. Actually JCAHO, since the last time --

8 Q. Right, it's new now, isn't it?

9 A. Yes. It's hard to get used to.

10 Q. And I'm sure Toledo Hospital is accredited
11 by the JCAHO, am I correct?

12 A. You're right, right.

13 Q. What level does this hospital have
14 accreditation for?

15 A. The problem I have with answering that
16 question is that my mind doesn't ever
17 register what the different levels are
18 because there is the JCAHO and the American
19 College of Surgeons and so many other
20 groups that have levels, but we are the
21 second level as far as trauma is concerned.

22 Q. Level II?

23 A. Level II, a trauma, for trauma. We're a

1 Level I for everything else.

2 Q. All right. So when you have to meet --
3 when your emergency room here has to meet
4 the JCAHO standards, those would be the
5 Level II standards set up for emergency
6 rooms; is that right?

7 A. I'd have to review those again before I can
8 answer your question completely. I just
9 don't remember what all the standards were
10 because of all these other organizations
11 that have them. The only difference we
12 have, and I don't mean to interrupt, but
13 maybe I can answer it, the only difference
14 between a Level I and what we have here is
15 that we do not have surgical attending
16 physicians in the building 24 hours a day.

17 We have every other specialist here
18 and the anesthesiologist, the emergency
19 physicians and all the other things you're
20 supposed to have, but we don't have
21 surgeons in the building 24 hours a day.

22 Q. So that's the only thing then that puts you
23 at a Level II rather than the Level --

1 A. Right, right. Level I if that's what they
2 call it, right.

3 Q. Now, when you say you don't have the
4 surgical coverage 24 hours a day --

5 A. No, I said surgical attendings.

6 Q. Attendings, so you do have residents?

7 A. Oh, yes.

8 Q. Surgical residents, chief residents or
9 third-year residents?

10 A. That's right.

11 Q. Well, am I correct, Doctor, that in these
12 JCAHO accreditations for emergency rooms
13 there are four separate levels, and each
14 one of those levels dictates whatever
15 standards have to be met by that particular
16 emergency room; is that correct?

17 A. As far as I remember, I think you're right.

18 Q. Doctor, you list I believe eight
19 publications on your curriculum vitae. It
20 appears that they date from 1972 through
21 one in 1987, am I right?

22 A. That is right.

23 Q. Are there any other publications of yours

1 that do not appear on this curriculum
2 vitae?

3 A. No.

4 Q. Am I also correct, Doctor, that the
5 majority of these publications deal with
6 management in medicine rather than the
7 clinical aspects of medicine?

8 A. You are right.

9 Q. And I believe there are two that deal with
10 clinical aspects?

11 A. Right.

12 Q. Those being which ones?

13 A. Well, the one on, a case report on
14 spontaneous rupture of the sigmoid colon,
15 which was done primarily by Mark Spiro, the
16 first author, at the time he was a
17 resident, and I worked with him on that.
18 And the last one, primarily by -- I was the
19 last author, so obviously I had the least
20 to do with it, but it was a study that we
21 did on interpose abdominal compression and
22 cardiopulmonary resuscitation and that was
23 published in one of our journals a couple

1 years ago.

2 Q. Doctor, is there anything about either of
3 those clinical publications that in your
4 opinion has any relevance at all to the
5 case we're here on today, the direct case?

6 A. No, not at all.

7 Q. Doctor, before we get into the specific
8 facts of Jesse Weaver's hospitalization and
9 eventual demise, I'd like to talk to you a
10 little bit in generalities about what you
11 see as the role of the emergency room
12 physician in terms of patients brought in,
13 unknown patient, no private physician on
14 the picture brought in by emergency
15 vehicle.

16 You're the emergency room physician
17 and what do you see as your role when that
18 patient is brought in?

19 A. Well, I think the role can be described in
20 various ways, but certainly the job of the
21 emergency physician is to perform an
22 evaluation of the patient as expeditiously
23 as possible based upon the patient's

1 complaint, determine if possible what
2 potential life-threatening problems may be
3 occurring and then intervene if possible in
4 attempting to reverse those whatever
5 life-threatening problems may be happening.

6 The secondary role would be to look
7 at maybe less acute problems and make a
8 determination as to whether or not the less
9 acute problem can be handled on an
10 inpatient or an outpatient basis. If an
11 inpatient basis, then what kind of
12 physician should that patient be referred
13 to, for instance should it be a
14 pediatrician or a surgeon.

15 And if on an outpatient basis, can
16 a definitive treatment be made for that
17 problem in the emergency department or must
18 there be follow-up, and if so, how soon
19 should that follow-up be.

20 Q. The follow-up on an outpatient basis?

21 A. Correct.

22 Q. Now, Doctor, when you said after the
23 initial evaluation that's done as quickly

1 as possible on this patient it's important
2 to determine if there are any
3 life-threatening problems, and then
4 intervene with those problems as quickly as
5 you can.

6 A. Correct.

7 Q. Now when you say that, do you mean you as
8 emergency physician intervening in those
9 problems or calling for a specialist in
10 whatever field you think is appropriate, or
11 what do you mean by intervening?

12 A. Well, there are a couple of factors that
13 make the definition of intervention change
14 a little bit. One factor would be the
15 acuteness of the problem. If this is a
16 problem that is so life-threatening that
17 the patient is indeed moribund on arrival,
18 then basically any physical intervention or
19 pharmacologic intervention that's
20 appropriate should be done right then.

21 Q. By the emergency --

22 A. By the emergency physician. If the problem
23 is either a determinate or seems to be not

1 quite as life-threatening, in other words
2 not an immediate within seconds threat to
3 life, then a decision has to be made
4 whether or not there is anything that could
5 be done to attempt to reverse the problem
6 by the emergency physician, or if another
7 decision may need to be made as to whether
8 or not there is only one particular
9 specialist who is qualified to attempt to
10 reverse that problem.

11 There are some rather specific
12 emergency problems which the definitive
13 intervention is usually not done by the
14 emergency physician.

15 Q. Like what?

16 A. An example of one of those would be an
17 acute subdural hematoma. The patient has
18 that injury to the head, is bleeding within
19 the head, has a change in their behavior
20 pattern that makes that fairly obvious and
21 yet there is time to have a neurosurgeon
22 come in and take the patient to the
23 operating room and evacuate the blood clot.

1 It is normally not the job of the
2 emergency physician to do that. However
3 that same patient who may be dying right
4 that second would be better to have the
5 emergency physician try to cut a hole in
6 the skull and release the blood than it
7 would be to let the patient die. So that
8 patient I guess describes both ends of that
9 particular spectrum.

10 Q. So involved within the emergency
11 physician's job when he's presented with
12 this unknown patient is to determine how
13 quickly something needs to be done, in
14 other words, how crucial the situation is?

15 A. Right, that's right.

16 Q. Assume for a minute Doctor that you
17 evaluate this patient, hypothetical patient
18 that came in by emergency squad into your
19 emergency room, and you determine that the
20 appropriate specialist that you think needs
21 to be called in is a surgeon, and you call
22 in that surgeon and he's there within a few
23 minutes. What does your role become at

1 that point?

2 A. The role of the emergency physician, once
3 the surgeon is available -- or is present
4 for instance a trauma case, is that is the
5 end of the role for the emergency physician
6 with the exception of the possibility of
7 communicating some information. It's
8 possible that the emergency physician
9 forgot or didn't communicate some portion
10 of the history, it would certainly be
11 appropriate to go back and do that.

12 It's possible that a laboratory
13 test ordered by the emergency physician
14 would come back, the emergency physician
15 would see that and say gee, that's very
16 important, I want to go tell the surgeon.
17 The emergency physician would do that.

18 As far as making any more treatment
19 decisions for that patient or any physical
20 interventions, that would strictly be in
21 the hands of the surgeon or whoever else
22 was called to take care of that patient.

23 Q. Would that include a surgical resident?

1 Assume it was a surgical resident that was
2 called in-house rather than an attending
3 surgeon?

4 A. Correct. That is a gray zone. I think
5 the emergency physician would have the
6 responsibility if a surgical resident were
7 taking care of the case to have a little
8 more idea of what the surgical resident was
9 doing. I'm not saying to intervene, to
10 push the surgical resident aside, to demand
11 that the surgical resident justify all
12 activities, but the emergency physician
13 would need to know a little bit more about
14 how the case was going in a general way to
15 determine whether or not the surgery
16 resident needed some help or the surgery
17 resident needed some information perhaps
18 that the emergency physician could provide.

19 Q. All right. Let's assume then further,
20 Doctor, that the specialist that was called
21 in by you or the emergency physician was a
22 surgery resident in the later years of his
23 residency who was in telephone contact with

1 an attending surgeon. What does your role
2 become then?

3 A. The role then would be one of almost
4 complete absence from the case unless the
5 nurses notified me that they noticed a
6 gross and obvious malpractice.

7 Q. Otherwise it's the attending's job to
8 direct the resident at that point?

9 A. That is correct.

10 Q. Even though he's not present in the
11 hospital?

12 A. That is correct. But let me elaborate a
13 little bit on the gross and obvious
14 malpractice. For instance, a patient who
15 is obviously in major trouble is being
16 discharged to home by the surgery resident.
17 It would be absolutely mandatory that the
18 emergency physician say stop, you can't do
19 this.

20 Q. But I take it what you're telling me is
21 that it's not your position as the
22 emergency department doctor to intervene if
23 you don't particularly agree with what the

1 attending may be telling the surgical
2 resident to do?

3 A. Well, no, that's not -- particularly agree
4 is another kind of a gray way of putting
5 it.

6 Q. Well, you said earlier blatant malpractice?

7 A. Right.

8 Q. And so what I'm doing is to make the next
9 step and saying short of that, am I wrong
10 in assuming you see your role as one of not
11 really stepping in?

12 A. No, you are correct, not really stepping
13 in.

14 Q. All right, Doctor, I'd like to talk a
15 little bit about your experience personally
16 in reviewing medical negligence cases.

17 A. Sure.

18 Q. How much experience have you had over the
19 last 25 years while you have been here at
20 Toledo Hospital?

21 A. Twenty-five?

22 Q. I beg your pardon, 15.

23 A. I was going to tell you that the first 10

1 years I didn't have any experience at all.
2 I probably have reviewed in that time 50
3 cases I would say total. I've never
4 counted them, but I would think that would
5 come pretty close to that since that
6 represents somewhere around what, seven a
7 year, something like that, but I would also
8 tell you that in the last year I've
9 probably -- last two years I probably
10 reviewed a little bit more than that. I
11 would say I probably reviewed 15 in the
12 last two years.

13 Q. Fifteen in two years or 15 per year?

14 A. No, 15 in 18 months would probably be
15 pretty accurate. So probably going on a 20
16 -- 10 a year rate right now.

17 Q. Any reason for the increase?

18 A. I have no idea.

19 Q. Dr. Janiak, have you reviewed medical cases
20 brought in medical negligence on behalf of
21 patients?

22 A. Yes, I have.

23 Q. And how many of those 50 cases that you

1 have reviewed, Doctor, would you say were
2 on behalf of patients?

3 A. I would say probably eight.

4 Q. And the rest were on behalf of emergency
5 room physicians or hospitals?

6 A. Correct. Except for in that gamut of 50
7 there were two civil cases where I was just
8 acting as a medical expert about extent of
9 injuries and the possibility of receiving
10 injuries and certain kinds of mechanics of
11 injury.

12 Q. Without comment on standards of care?

13 A. That's correct.

14 Q. And, Doctor, how much of your time on a
15 weekly basis in terms of hours would you
16 say you spend on legal work?

17 MR. COWDREY: You mean work that
18 we're talking about now, reviewing
19 cases:

20 Q. Reviewing cases for litigation.

21 A. Oh, maybe two to three hours a week.

22 Q. Is that an average?

23 A. No, the average would be less than one, but

1 I'm speaking now just during this last busy
2 time.

3 Q. During the last 18 months?

4 A. Right.

5 Q. And, Doctor, do you charge for these
6 reviews?

7 A. Yes, I do.

8 Q. And what is your rate, hourly rate?

9 A. Two hundred dollars per hour.

10 Q. Is that the same amount, Doctor, that you
11 charge for a deposition?

12 A. Yes, ma'am.

13 Q. Or trial testimony?

14 A. Yes, ma'am.

15 Q. Have you testified at a trial of any of
16 these medical negligence cases?

17 A. Yes, I have.

18 Q. How many times?

19 A. I believe it was three.

20 Q. Any of those in Ohio?

21 A. Yes.

22 Q. Which counties?

23 A. One was in Defiance. Whether that's

1 Defiance County I can't tell you, I don't
2 know what county that is.

3 The other one was in Florida and
4 another one was in Green Bay, Wisconsin.

5 Q. I thought you said three times in Ohio
6 trials?

7 A. Oh, I'm sorry, three trials.

8 Q. Three trials, one in Ohio?

9 A. Yes, I'm sorry, I didn't mean to confuse
10 you there.

11 Q. So I assume then, Doctor, 50 some cases
12 that you have had your deposition taken on
13 a number of occasions?

14 A. I would say probably 15 total.

15 Q. Now am I correct, Doctor, in assuming that
16 you were contacted on the Weaver case by
17 Mr. Cowdrey?

18 A. That's right.

19 Q. You had previously reviewed a case or cases
20 for the Jenks Cowdrey firm?

21 A. Yes.

22 Q. Now one of those cases is the Kim Sierra
23 case; is that correct?

1 A. That's right, yes.

2 Q. How many other cases for the Jenks' firm
3 besides the Kim Sierra case and the Jesse
4 Weaver case?

5 A. I think there was one other.

6 Q. One other?

7 A. One other, but I don't remember the name of
8 it right now.

9 Q. Did that case go to trial, the other one?

10 A. No, no.

11 Q. All right, were you contacted by letter or
12 telephone by Mr. Cowdrey on the Weaver
13 case?

14 A. I believe it was initially by telephone,
15 and then asking me if I'd be interested in
16 reviewing the case and then a follow-up
17 letter.

18 Q. Now at the time you were contacted
19 initially on the Weaver case, were you
20 already obliging the Jenks' firm as an
21 expert witness on the Sierra case?

22 A. I don't think so. I can tell you this, I
23 think you and I have met before over the

1 Sierra case --

2 Q. Yes.

3 A. And at that time, I didn't know anything
4 about this case, but the exact timing I
5 don't know.

6 Q. At the time of the -- well, to pin this
7 down, your deposition was taken in the
8 Sierra case by me here in this same room on
9 June 2nd of this year, 1989. Do you
10 remember that?

11 A. I don't remember the date, I remember the
12 deposition.

13 Q. That was June 2nd. Now at that time you
14 had been contacted as I recall to review
15 the Weaver case. Are you saying you had
16 just agreed to review it and had not seen
17 any of the records at that time?

18 A. I'm saying I don't remember, I just don't
19 know.

20 Q. Doctor, when you first received a letter
21 regarding the Weaver case, did you also
22 receive some materials to review at that
23 time?

1 A. Yes.

2 Q. What were they?

3 A. I received initially the records from
4 Grandview Hospital and a copy of the
5 Complaint. And then as time went on, and I
6 can't tell you the timing, I received
7 depositions of Dr. Radon, Dr. Myers, Dr. --
8 is it Keighley?

9 Q. Yes.

10 A. Dr. Rank, Dr. Fisher, Dr. Schaeffer. And
11 that's all I've seen that I remember or
12 know about.

13 Q. Well, I'm going to ask you about some other
14 things and if you haven't seen them, just
15 say so, that have come to -- or have
16 happened in this case.

17 Have you ever seen any x-rays?

18 A. I have not.

19 Q. Have you ever seen an autopsy report?

20 A. Yes, I believe that was part of the initial
21 medical record material, that I have seen
22 an autopsy report.

23 Q. Have you ever seen any previous medical

1 records of Mr. Weaver? When I say
2 previous, I mean previous to this Grandview
3 incident on March 29th and 30th of '87?

4 A. I understand. I would have to look back
5 and see whether I have looked at those
6 records or not. I remember comments about
7 previous health care problems, but I don't
8 specifically remember seeing records, but I
9 may have.

10 Q. You mentioned I believe six depositions
11 that you had read; is that right?

12 A. That's right.

13 Q. There has also been a deposition of Mrs.
14 Weaver. Have you read that?

15 A. I don't believe I have.

16 Q. There has also been a deposition of a Dr.
17 Charles Johnson; have you read that?

18 A. No, ma'am.

19 Q. What was your understanding of the facts of
20 this case, Dr. Janiak, prior to reviewing
21 any of these materials?

22 A. That a patient was injured in an automobile
23 accident and was brought into an emergency

1 department and was -- had a rather stormy,
2 downhill course of deterioration which
3 didn't respond to any interventions and
4 died.

5 And a little bit of elaboration on
6 that, it is apparent that they -- it seemed
7 that the patient had chest injuries since
8 the steering wheel had been damaged in the
9 car, and that an emergency physician was
10 involved initially. And the emergency
11 physician contacted a surgeon and that a
12 surgeon and surgical resident were involved
13 in some way.

14 Q. How did you learn those facts prior to any
15 review of the records?

16 A. Well, the answer I guess would require a
17 total recall on my part and I don't
18 remember that. But I --

19 Q. I mean, were those provided to you verbally
20 by Mr. Cowdrey or in a letter or --

21 A. No, I think that was provided verbally in
22 the outline of the case.

23 Q. Do you remember having any other facts

1 other than what you have recited to me?

2 A. No, I don't.

3 Q. Do you know Dr. Gordon Myers?

4 A. I do not.

5 Q. Or Dr. Keighley or Dr. Rank?

6 A. No.

7 Q. Do you know Dr. Donald Schaeffer?

8 A. No, I don't.

9 Q. Dr. Radon?

10 A. No.

11 Q. How about Dr. Charles Fisher?

12 A. No.

13 Q. Do you know of Dr. Fisher?

14 A. No.

15 Q. Now, Doctor, are you aware that the
16 emergency group involved in the Weaver case
17 is the same one that's involved in the
18 Sierra case, the TMES, Thomas Moochey
19 Emergency Group?

20 A. No.

21 Q. You were not aware of that?

22 A. No, I was not.

23 Q. Were you aware that Southview Hospital in

1 the Kimberly Sierra case is an affiliate
2 hospital or satellite hospital of Grandview
3 Hospital in this case?

4 A. No, I was not.

5 Q. Well, you do know that Dr. Bruce -- is it
6 Bruce Rank? Dr. Bruce Rank is the same
7 Defendant in the Sierra case and the Weaver
8 case?

9 A. No, I didn't know that either.

10 Q. Did you then proceed, Dr. Janiak, to review
11 the materials we've talked about?

12 A. Yes, I did.

13 Q. And I take it since we're all sitting here
14 in Toledo today that you are prepared to
15 offer opinions as to Mr. Weaver's treatment
16 and care at the emergency room at Grandview
17 Hospital; is that right?

18 A. That's correct.

19 Q. Are you also prepared to offer opinions at
20 trial, Doctor, on Jesse Weaver's cause of
21 death?

22 A. Yes.

23 Q. Have you been asked or are you prepared to

1 offer any opinions regarding the life
2 expectancy of Jesse Weaver had he not
3 expired on the 30th of March, 1987?

4 MR. COWDREY: Objection.

5 Assumes that he would have an
6 opinion concerning the fact that he
7 would have survived that particular
8 incident, but go ahead and answer,
9 Doctor.

10 A. I have neither been asked nor do I intend
11 to offer an opinion about his life
12 expectancy.

13 Q. Well, we can eliminate one thing, right?

14 A. Hurray.

15 Q. Doctor, what are in the general sense the
16 opinions that you are prepared to offer
17 regarding the care of Jesse Weaver at
18 Grandview emergency room on the 30th of
19 March 1987?

20 A. In a general sense, they are that this
21 gentleman suffered severe and irreversible
22 injuries when he had his accident and that
23 interventions would have been at best

1 prolonged his life by a space of hours, and
2 that there is no relationship between the
3 activities or action of the emergency
4 physician and the patient's demise.

5 Q. Are you prepared to offer an opinion, Dr.
6 Janiak, that the care received by Jesse B.
7 Weaver on the evening of March 29th and the
8 early morning hours of March 30th, 1987,
9 met ordinary and reasonable standards of
10 emergency care?

11 MR. COWDREY: Are we talking
12 about Dr. Myers or what?

13 MS. STOCKLIN: Is that what I
14 said?

15 MR. COWDREY: You said emergency
16 care, but are you talking about --
17 you asked him a question as to --

18 MS. STOCKLIN: I'm talking about
19 the totality of the care received
20 by Dr. Myers, Dr. Keighley and Dr.
21 Rank and any other medical
22 personnel at Grandview emergency
23 room during that time.

1 Q. Are you prepared to offer the opinion that
2 all of that care met ordinary and
3 reasonable standards of care?

4 MR. COWDREY: I'm going to --
5 let me object, Doctor. Dr. Janiak
6 has been identified as an expert
7 witness on behalf of Dr. Myers, his
8 emergency room physician. He has
9 not been asked to express any
10 opinions as to Dr. Keighley or Dr.
11 Rank, but go ahead and answer if
12 you can, Doctor.

13 Q. If you need to break it down for me, feel
14 free, Doctor.

15 A. Well, based on the depositions and the
16 information in the emergency medical
17 record, I'm prepared to state that Dr.
18 Myers performed within the standard of care
19 that I would expect. However, in
20 retrospect, there certainly were many
21 discussions about the timing of the
22 intubation for this patient, and I want to
23 point out that I would have differed from

1 Dr. Myers on the timing of the intubation,
2 but that is a judgment call based on both
3 the clinical and laboratory evidence.

4 So just to be very clear, I think
5 he met the standards. I think if I were
6 doing it, I would have intubated the
7 patient a little sooner.

8 Q. Do you want to define a little for me?

9 A. Probably 30 to 60 minutes sooner.

10 Q. Is that the only difference, Doctor, that
11 you see in the care that Dr. Myers provided
12 and the care that you might have provided
13 under the same circumstances?

14 A. That is a little bit hard to answer because
15 since that did not happen, the approach
16 would have been in my scenario a earlier
17 intubation followed by repeat blood gases,
18 and everything else I would have done would
19 have depended on the results of those
20 gases. And since this is hypothetical, we
21 don't know what the results are.

22 Q. We only know what the results of the blood
23 gases were after the intubation actually

1 took place?

2 A. That's right.

3 Q. About 12:50 or 1 a.m.?

4 A. Right.

5 MR. COWDREY: Objection. I
6 think the record indicates 12:45
7 that there was an intubation, but
8 go ahead.

9 Q. Is that your understanding, Doctor, that
10 there was an intubation at 12:45?

11 A. I would have to look at the record again, I
12 couldn't tell you.

13 Q. Here's a copy of the chart.

14 A. Well, according to the record it's timed at
15 12:45. It says several things. Patient's
16 jaw clenched, Anectine given to facilitate
17 intubation. So sometime right about that
18 time it was attempted, but then there's a
19 note at 12:50 that says endotracheal tube
20 inserted by Dr. Keighley, so it would be
21 fairly close to 12:50, recognizing that no
22 emergency record is accurate to the minute.
23 Q. Doctor, just so -- because I've been having

1 some trouble with this myself, so I'm
2 looking for a little help. Directing your
3 attention to Page 20 of this record, which
4 I believe are reports of portable chest
5 x-rays, it appears that the third one on
6 that page was a portable chest x-ray taken
7 at 12:50.

8 A. All right, say that again, please?

9 Q. It appears that the third report down on
10 that page is a report of a portable chest
11 done at 12:50?

12 A. Right.

13 Q. And is it fair, Doctor, that an endotrach.
14 tube would show up on this x-ray probably?
15 See, I'm trying to narrow down this time
16 and it looks to me like what we can
17 probably deal with here is somewhere
18 between 12:50 and 1 a.m. he was probably
19 intubated, because had it been at 12:50 or
20 before, we would have seen a tube there,
21 wouldn't we?

22 MR. COWDREY: Objection. Go
23 ahead and answer.

1 A. Well, making an assumption that the time is
2 accurate to the minute, and the patient was
3 intubated -- well, first of all it's
4 impossible to take a chest x-ray and
5 intubate a patient simultaneously.

6 Q. All right.

7 A. If the tube had gone in just seconds before
8 the chest x-ray was taken, yes, you would
9 see it and the standard of care in
10 radiology is to comment on that. If the
11 tube had gone in seconds after the x-ray
12 was taken, then essentially the patient
13 would be intubated before the x-ray was
14 available, or even developed.

15 So I wish I could help you exactly
16 and we are frustrated by this in all
17 records, and until we get giant computers
18 that record every movement of every person,
19 we'll never be able to time everything to
20 the second.

21 Q. Well, let's go back to your opinions,
22 Doctor. Let me encapsulate where we are at
23 this point, if I may. You correct me

1 please if I'm wrong. It's your opinion
2 that Jesse Weaver suffered injuries that
3 were destined to cause his demise at the
4 time of his automobile accident; is that
5 correct?

6 A. That is correct.

7 Q. And it's also your opinion if I understand
8 you correctly that no medical intervention
9 would have changed that projection?

10 A. Yes, that is my opinion.

11 Q. All right. Well, let's talk about what
12 those injuries were in your opinion,
13 Doctor?

14 A. Okay.

15 Q. What were they?

16 A. Oh, all right. I think the patient had
17 injuries to two major structures within his
18 chest, his heart and his lungs.

19 Q. What kind of injuries?

20 A. I think they were contusions to both of
21 those organs or bruises.

22 Q. All right, Doctor, are bruises to the heart
23 and/or the lungs fatal injuries?

1 A. No, like any bruises it depends on the
2 extent.

3 Q. All right, so they may be fatal, they may
4 not?

5 A. That's correct.

6 Q. In your opinion, the contusions to Mr.
7 Weaver's heart and lungs were so severe as
8 to be fatal no matter what the
9 intervention?

10 A. Right.

11 Q. On what do you base that opinion, Doctor?

12 A. Well, on seeing a number of patients that
13 have come in able to speak, able to walk,
14 able to move. Perhaps somewhat
15 uncooperative as this patient was who
16 unfortunately had a very precipitous
17 downhill course over a very short time
18 period, that is a couple of hours, and
19 could not be resuscitated regardless of the
20 timing of the intubation or any further
21 therapeutic measures that were taken on.

22 The main thing in this case is the
23 progression, the rapid progression of his

1 problem. If a patient has an accident and
2 within a couple of hours is in serious
3 trouble, as this patient was, then chances
4 of resuscitating that patient are very,
5 very low and as a matter of fact, the major
6 factor that would apply to survivability
7 would probably be age.

8 This patient -- if this patient had
9 been 18, I might think there would be a
10 chance of surviving. I'm not sure what the
11 chance would be. But at age 47 with a
12 history of some heart disease, not terrible
13 heart disease but some heart disease, these
14 patients just don't make it. They just
15 expire within a few hours no matter how
16 much intervention there is from this kind
17 of injury because this is not a surgically
18 correctable injury that I'm describing.

19 It's one that is on a cellular
20 level, and the cells are so damaged that
21 they can't exchange oxygen. The heart
22 cells are damaged so much so that the heart
23 doesn't pump appropriately, so not only do

1 you have a poor oxygen exchange from the
2 lung tissues, but you have a compromised
3 ability of the heart to pump blood through
4 the lungs and everywhere else in the
5 system, and so you have an almost a --
6 well, it is an irreversible course which is
7 apparent fairly early in the problem.

8 I have seen these patients very
9 aggressively treated with paralyzation and
10 intubation within oh, 15, 20 minutes to a
11 half hour of their arrival placed on
12 aggressive positive pressure ventilation
13 with oxygen levels that get worse and worse
14 and worse and worse and within a few hours
15 they die.

16 So I'm saying it's more likely than
17 not that's what this patient had.

18 Q. So I guess then, Doctor, the answer to my
19 question to the basis for your opinion goes
20 to your experience with trauma patients;
21 is that correct?

22 A. Right.

23 Q. Does it go to anything in particular in

1 these records or this chart that you can
2 point to as the basis of your opinion that
3 this man died from pulmonary and myocardial
4 contusions?

5 A. Well, certainly you have to ask yourself
6 what else might it be that killed this
7 patient. Maybe I'm totally wrong, I would
8 say to myself, and there must be something
9 else that happened. Did the patient have a
10 stroke? Well, no, there's no real evidence
11 that he behaved as if he had a stroke and
12 he didn't have paralysis on one side or the
13 other, so that doesn't seem to be
14 reasonable.

15 Did the patient have a ruptured
16 aorta which can happen with this? Well, it
17 doesn't seem like that because that's not
18 what we see on the chest x-rays, we don't
19 see evidence of a ruptured aorta so I don't
20 think that would be the problem.

21 Did he have severe bleeding inside
22 of his abdomen? No, we don't seem to see
23 that he's bleeding to death anywhere, so

1 that is not what caused his demise.

2 So then we're left with maybe some
3 other problem that occurred which is not
4 related to the injury. Maybe the patient
5 died because he took an overdose of
6 medication, but we don't see anything in
7 the chart consistent with that.

8 And as some of the Plaintiff's
9 experts have stated, maybe the patient had
10 a heart attack. But we did an autopsy on
11 the heart and we don't see severe narrowing
12 of the coronary artery. As a matter of
13 fact, we see coronary arteries that are not
14 all that bad for a patient of this age who
15 is obese.

16 And so I would have -- if the
17 Plaintiff's experts were to be right, I
18 would have to speculate an incredibly weird
19 coincidence in that this patient had this
20 heart attack without narrowed coronary
21 arteries that caused the accident or
22 occurred as the accident was occurring, and
23 when you smash yourself into a tree or a

1 stationary object and crush the steering
2 wheel, any emergency physician who
3 immediately looks for a pre-existing heart
4 attack is committing malpractice. And it
5 has to be pulmonary and cardiac contusion
6 that are causing this problem.

7 Q. All right, Doctor, do you disagree that Mr.
8 Weaver suffered ischemia to his heart?

9 A. No, he suffered -- I do not. He suffered
10 ischemia to all the cells of his body.

11 Q. All right, do you disagree that Mr. Weaver
12 suffered prolonged severe hypoxia?

13 A. No, I agree. He certainly did.

14 Q. Would you agree, Doctor, that severe
15 profound hypoxia causes a heart to arrest?

16 A. I would agree that it would cause any
17 living tissue to stop functioning normally,
18 and that would include the heart.

19 Q. In your opinion, Doctor, was Mr. Weaver's
20 hypoxia irreversible at all points in time
21 during the two and a half hours prior to
22 intubation and following, for that matter?

23 A. Yes. I can elaborate a little bit on that.

1 In my opinion, and I think I said it in
2 another way before, it would have been
3 reversible but only temporarily. The
4 course of his illness would have continued
5 his pulmonary contusion, would have
6 continued to prevent adequate oxygenation,
7 his myocardial contusion would have
8 continued to prevent adequate pumping, and
9 so you would have seen most likely had
10 there been more aggressive airway
11 intervention a temporary increase in the
12 oxygen level in the blood, a temporary
13 decrease in the carbon dioxide, a temporary
14 increase in the pH which would be a trend
15 towards normalization followed by a
16 re-reversal of conditions and a worsening
17 followed by an increase in the levels on
18 the respiration machine that would give you
19 an increase again, and this seesaw course
20 would have continued over several hours and
21 the patient would have died like all the
22 ones I've seen.

23 Q. So, Doctor, you know, I'm having trouble

1 following you here so if you can help me
2 out I'd appreciate it. When you get
3 patients that have an automobile accident
4 in which the steering wheel is crushed, is
5 it your opinion that the probability is
6 those patients are going to die?

7 A. No. Do you have to add that to the
8 patient's clinical condition? For
9 instance, if the steering wheel is crushed
10 and the patient is feeling fine and has no
11 reduction in blood gas problems, no low
12 blood pressure, no test evidence that
13 there's anything wrong, no, it's not my
14 opinion that they'll die. They'll probably
15 do fine, although I'd be quite surprised
16 that they would.

17 What my opinion is is if you add
18 the historical findings as are related by
19 the rescue squad with the patient's age and
20 his course over the first two hours in the
21 emergency department, it is my opinion that
22 those patients will not survive.

23 Q. Doctor, if you are presented with possible

1 -- with blunt chest trauma like we have
2 here and possible pulmonary or myocardial
3 contusion or both, how do you treat it?

4 A. There's only two major ways you can treat
5 this problem. The first one is with drugs
6 to control the blood pressure, if that is a
7 problem, or the heart rhythm if that is a
8 problem, depending on the complications of
9 the myocardial contusion.

10 The problem with low oxygenation
11 basically can only be controlled by forcing
12 more oxygen into the lungs to get that
13 oxygen to go across the membranes and into
14 the blood. That can be done either with or
15 without intubation, although we always
16 intubate because the physics of doing it
17 without intubation are quite tough.

18 You have to put the patient in a
19 hyperbaric chamber to increase pressure
20 that way. So you increase the pressure
21 just to the lungs by putting a tube in.

22 The tube itself in this patient is
23 going to do pretty much next to nothing.

1 Q. In this particular patient?

2 A. In patients like this, yes.

3 Q. So in your opinion intubating wouldn't have
4 helped anyway?

5 MR. COWDREY: Objection, that's
6 not what he said. Go ahead.

7 A. Well, that's one way of saying it. In my
8 opinion, if anyone would have intubated
9 this patient and only intubated the patient
10 at the beginning of this case or at any
11 point in between, there would be -- it
12 doesn't change the clinical position.

13 Q. Then what else needed to be done?

14 A. Then the next step after intubation is to
15 first make a determination, you always have
16 to question yourself, I did this to the
17 patient, was there a change. You make a
18 determination by doing a clinical
19 assessment and appropriate tests. In this
20 case, blood gases are probably the
21 appropriate test.

22 And my opinion is, had that been
23 done, the blood gases would have still been

1 bad. The only next step is positive
2 pressure on the lungs. It's a --

3 Q. PEEP?

4 A. -- PEEP is what you would use, and the
5 exact level is titrated or adjusted based
6 on the blood gas response. What I'm saying
7 is, given the PEEP, the patient would have
8 shown a temporary improvement followed by a
9 progression of the damage to the lungs with
10 a decrease in oxygen level, an increase in
11 PEEP pressure with another improvement, and
12 that seesaw would have continued to happen
13 until the patient eventually had a maximum
14 PEEP, complications of PEEP or cardiac
15 arrest or both.

16 Q. Dr. Janiak, you indicated that earlier that
17 the other things to do besides oxygenating
18 a patient where you suspect a pulmonary or
19 myocardial contusion is to treat the blood
20 pressure if there is a problem and treat
21 the heart rhythm situation if there is a
22 problem?

23 A. If those are problems, that's correct.

1 Q. If there's problems, all right. When you
2 said treat the blood pressure if there is a
3 problem, are you talking about high or low
4 or either?

5 A. Basically I'm talking about low, because in
6 a patient like this it would be very
7 unusual to have very high blood pressure.
8 Although, if the blood pressure was quite
9 high, and I didn't see that in this
10 particular case, but if it was very high,
11 then one would look for a ruptured aorta
12 because those two things happen to go
13 together.

14 The blood pressure that this
15 patient had on arrival is not particularly
16 high, so I would never treat it. I think
17 that that would be inappropriate.

18 Q. All right. And assuming a patient where
19 you suspected a pulmonary contusion with
20 low blood pressure which you would consider
21 a problem, how would you treat that?

22 A. Well, the first thing -- is this patient
23 just presented to me as this brand new --

1 Q. Well, I'm asking you, when you said treat
2 the blood pressure if it's a problem, now
3 you've told me it would probably be low,
4 that it would be a problem, I'm asking you
5 how would you treat it?

6 A. Okay.

7 Q. Whether it's on presentation or any other
8 time?

9 A. Well, if it's on presentation, the first
10 thing I'd want to do is try and make a
11 determination of why it was low because
12 this is a hypothetical patient that you
13 gave me, so I'd want to know if the patient
14 was bleeding or had another reason for low
15 blood pressure.

16 The hypothetical patient could be a
17 26-year-old lady who weighs 85 pounds who
18 always has low blood pressure, and if you
19 can find that out, then treating what she
20 always has is not appropriate.

21 But those things aside, if it's a
22 low blood pressure cause of a myocardial
23 contusion and the low blood pressure is so

1 low that it's causing some circulatory
2 problems, then one would have to add
3 medication to increase the blood pressure
4 and the choice of medication varies
5 depending on the literature, but it's
6 basically an alpha stimulating drug that
7 causes an increase in the strength of the
8 contraction of the heart and increases the
9 vessel spasm in the arteries to cause a
10 pressure increase and improve perfusion.

11 So there's 40 different drugs that
12 we use for that. The choice depends on the
13 physician at the time.

14 Q. All right, assuming a heart rhythm problem.
15 Are you talking about arrhythmias?

16 A. Yes.

17 Q. And what would the treatment be for that?

18 A. It depends on which rhythm problem it would
19 be. If the rhythm problem would be a
20 ventricular fibrillation, then treatment
21 would be counter shock. If the rhythm
22 problem would be multiple premature
23 ventricular contractions, then the normal

1 treatment would be a drug like Lidocaine
2 intravenously.

3 If the rhythm problem would be a
4 very, very fast rate with very poor blood
5 pressure, then once again you might shock
6 that patient. If it was a moderately fast
7 rate with a moderate problem, you might use
8 a drug to try to convert the rhythm. So it
9 depends on which rhythm abnormality as to
10 which treatment you'd use, but I think the
11 bottom line is you'd use either a drug or
12 electricity in some way to control the
13 heart rate.

14 Q. Did you find anything, Doctor, in your
15 review of the autopsy report which in your
16 opinion confirms pulmonary or myocardial
17 contusion in this case?

18 A. Well, two things. One of the common
19 findings of myocardial contusion is that
20 there aren't any real significant findings
21 in the heart. One of the common findings
22 in pulmonary contusion is that the lungs
23 look kind of purple and mottled and swoosh,

1 just like you would if somebody punched you
2 real hard in the arm and you get black and
3 blue.

4 So it tends to show up a little bit
5 more in the lungs than it does in the
6 heart, although there are all varying
7 degrees of contusion with varying degrees
8 of findings.

9 Q. Well, in your opinion, these contusions
10 were severe; is that right?

11 A. Yes, that's correct.

12 Q. Would you expect to find confirmation on
13 the autopsy of that?

14 A. I would expect to see something in the
15 lungs, and we did, and I would not be
16 surprised if you saw nothing in the heart
17 and that's basically what was found.

18 Q. I guess it's a matter of semantics here,
19 Doctor, and what I'm looking for is the
20 difference between anything on the autopsy
21 report which may be consistent with your
22 opinion that there is pulmonary contusion
23 and anything on the autopsy report which in

1 your opinion confirms it. Are you
2 following me?

3 A. Yes. I think that the autopsy confirms
4 pulmonary contusion and is consistent with
5 myocardial contusion; is that what you --

6 Q. And let's look at this if we can, and I
7 would like you to tell me which part of the
8 autopsy report which I've just handed to
9 you in your opinion confirms pulmonary
10 contusion?

11 A. Well, there are certain parts of the lung
12 examination, the right lung weighs a lot,
13 there is a deeper mottled red purple color
14 to various parts of the lung, but he
15 doesn't describe exactly where that is.

16 There are petechial hemorrhages
17 noted in the lungs. I guess that's about
18 all that one can say about the consistency.

19 Q. And in your opinion, Doctor, that confirms
20 pulmonary contusion to the exclusion of any
21 other diagnosis; is that right?

22 A. Well, I guess I have to be careful about
23 that. If this patient had, if these were

1 the same findings on a patient that had
2 died from cancer or something, I wouldn't
3 be able to tell you, but I have to put
4 these findings together with the history.
5 So maybe I would be more accurate to say
6 that unless you put the whole picture
7 together, there is never anything on any
8 report that is consistent with anything,
9 and we could take that to some ridiculous
10 extent, but --

11 Q. Well, Doctor, is it fair to say that the
12 petechial hemorrhages appearing in the
13 lungs are consistent with and could confirm
14 hypoxia?

15 A. Well, I think it's fair to say they're
16 consistent with, but it would only be fair
17 to say as we have just gone over with what
18 I said that they don't confirm hypoxia in
19 the same sense --

20 Q. In the same sense that they don't --

21 A. Right, and that's exactly the same sense.

22 Q. Doctor, I've handed you the chart and
23 please feel free to refer to the nurses'

1 notes or anything in there that you would
2 like to refer to during the next questions
3 I have for you.

4 As you will recall, this patient
5 presented to the emergency room at about
6 10:30 p.m. on a Sunday evening, and in case
7 you didn't know, it was a Sunday evening.

8 A. I didn't know that.

9 Q. And according to Page 6 of this chart, and
10 Dr. Myers I believe notes, he presented
11 with a respiratory rate of 44 and a blood
12 pressure of 220 over 140; is that correct?

13 A. Right, right.

14 Q. And you were aware of that?

15 A. Yes.

16 Q. All right. What else, Doctor, is your
17 understanding as to this patient's
18 presentation besides a respiratory rate of
19 44 and that particular blood pressure?

20 A. Well, there's a -- you mean, are you asking
21 me to read the history and physical?

22 Q. Well, now I'm just asking you to tell me
23 about your understanding of how this

1 patient presented to the hospital at about
2 10:30?

3 A. Well, he's indicated to be combative, so he
4 was uncooperative and as near as I can put
5 everything together was pacing about the
6 floor, was not -- and appeared to be
7 extremely anxious. He had some wheezes in
8 his chest, he was sitting up on the cart
9 and just absolutely would not sit still.

10 I did not remember a note about him
11 complaining of specific pain in his
12 extremities or other kinds of complaints
13 that would relate to localized trauma.

14 Q. He did present however a complaint of
15 breathing problems, shortness of breath, et
16 cetera, right?

17 A. Absolutely, right.

18 Q. He also presented, I'm not sure if he said
19 this, with a history of the motor vehicle
20 accident, one-car motor vehicle accident in
21 which apparently the steering wheel was
22 crushed?

23 A. Right, I think that information came from

1 their rescue squad or life squad, whoever
2 picked him up. I'm not sure whether the
3 patient told him that or he found that out
4 from the squad or the doctor, I don't --

5 Q. Now, Doctor, you're also aware that this
6 was a fairly large in size 46 I believe
7 year old black male, correct?

8 A. Yes, ma'am.

9 Q. All right. Let's then using that
10 presentation as you have -- as we have
11 talked about, and I would like you to tell
12 me what you see as the pertinent evaluation
13 on this particular patient that you would
14 make and what treatment, if any, you would
15 proceed with?

16 MR. COWDREY: Objection. You
17 know, Dr. Janiak is here and he's
18 indicated to you that what he would
19 have done in this particular case
20 may have been different than what
21 Dr. Myers did and he has indicated
22 to you that that's based upon
23 clinical judgment, and he's already

1 testified that in his opinion Dr.
2 Myers met the standard of care as
3 he was presented with this patient.

4 Now with that objection
5 noted, you can ask him the
6 questions, but I just want you to
7 realize, you know, that what he
8 would have done is different.

9 A. Faced with a patient like this, I would
10 have -- and recognizing that he was pacing
11 or moving about, and I believe the patient
12 had a cervical collar on, I would have
13 asked him briefly, since he was able to
14 talk, whether or not there was any area of
15 his body that was causing him particular
16 pain, for instance his neck or his back.

17 If he said no, I would probably
18 spend a few seconds pushing on those areas
19 just to see whether I had missed something
20 really obvious, and probably in 30 seconds
21 would have made a determination that there
22 really wasn't any significant spinal injury
23 or head injury that I was dealing with.

COMPUTER TRANSCRIPT

1 Following that, and at the same
2 time I would expect that the nurses would
3 be starting an IV on the patient and that
4 they would be administering supplemental
5 oxygen since he obviously was having
6 trouble breathing.

7 I would have the patient -- I would
8 not have the patient, would be in a trauma
9 evaluation room and would have very
10 frequent vital signs taken without me
11 asking because that would be a policy.

12 The physical examination would then
13 focus on the heart and lungs and so would
14 the laboratory tests that I would order,
15 which would include a chest x-ray and blood
16 gases and electrocardiogram.

17 Q. Doctor, when you say since this patient was
18 complaining of problems breathing, you
19 would assume that your nurses would be
20 oxygenating this patient?

21 A. That's right.

22 Q. How would you assume they would be
23 oxygenating this patient?

1 A. They would apply nasal oxygen by cannula.

2 Q. How much?

3 A. Well, I would expect it would be no more
4 than 5 liters and no less than 2 liters.

5 Q. Than what?

6 A. No less than 2 liters.

7 Q. What would be your purpose in ordering the
8 arterial blood gases?

9 A. Well, the other thing I probably left out
10 is to ask the patient whether he always
11 breathes like this and whether or not that
12 was his major discomfort. I'm assuming his
13 answer would be no, I don't always breathe
14 like this and my major problem is I can't
15 breathe right.

16 So recognizing from the history
17 that the patient had smashed into the
18 steering wheel and recognizing that we are
19 dealing with probably a 90 percent chance
20 of pulmonary contusion, which is already
21 within a space of I guess an hour from the
22 accident causing respiratory distress that
23 I would want to get some idea of how bad

1 the blood gases were.

2 Q. And why would you get an electrocardiogram?

3 A. Because of the history of the mechanism or
4 injury as associated with a very high
5 incidence of cardiac contusion also.

6 Q. And would this be a 12 lead
7 electrocardiogram?

8 A. Right. The patient already would have been
9 automatically placed on a monitor pattern
10 to see what his rhythm was.

11 Q. Would you have placed this patient at this
12 point on any medication?

13 MR. COWDREY: Objection. Go
14 ahead and answer.

15 A. Okay. Well, assuming that oxygen is a
16 medication, yes, but aside from oxygen, no.

17 Q. Would you wait to see what the ABG's said
18 first?

19 A. Well, not just the ABG's, I want to look at
20 the blood gases, the chest x-ray and the
21 cardiogram, all three, and then repeat the
22 vital signs.

23 Q. On initial presentation that we have been

1 talking about, Doctor, you have told me
2 what your first steps would have been.
3 Would you at that point see the necessity
4 of calling in an attending?

5 A. I would know that I was going to call an
6 attending when the patient arrived within
7 let's say a half-hour, but I wouldn't know
8 which attending. So I wouldn't make the
9 call.

10 Q. And how would you determine which
11 attending?

12 A. By reviewing the results of the three tests
13 that I outlined, the blood gases, the
14 cardiogram and the chest x-ray.

15 Q. And what would your choices of an attending
16 be in your own mind prior to reviewing
17 those results?

18 A. Thoracic surgeon would be one choice.
19 General surgeon would be a person I would
20 call on a patient like this in 100 percent
21 of the instances, and depending on the
22 diagnosis, a pulmonologist.

23 Q. Now wait a minute, I didn't follow your

1 last comment. You said a general surgeon
2 would be the person you would call 100
3 percent of the time?

4 A. Yes.

5 Q. What, with this patient as we know he
6 turned out or what?

7 A. No, with all seriously injured patients in
8 accidents.

9 Q. So that's sort of an automatic reflex, you
10 call a general surgeon?

11 A. Right.

12 Q. In your opinion, Doctor, is that a standard
13 of care in a multiple trauma like this?

14 MR. COWDREY: Objection.

15 A. We do that at this hospital. I believe the
16 American College of Surgeons suggests that.
17 I don't believe personally it would be a
18 deviation from the standard of care in this
19 particular case to call a thoracic surgeon
20 alone.

21 Q. And at what point, Doctor, in time in your
22 opinion would an attending, whether a
23 thoracic surgeon or a general surgeon have

1 to be called in order to meet the standard
2 of care in this case?

3 MR. COWDREY: Objection, go
4 ahead and answer.

5 A. Assuming and optimally speaking one could
6 have the results of all of the tests that I
7 outlined within 45 minutes, I know that
8 sounds like a long time, but when you're
9 taking care of these patients it does take
10 a little while. After reviewing the chest
11 x-ray I would make a decision at that
12 point.

13 So if I had the --

14 Q. So that would be the --

15 A. Decision point.

16 Q. The definitive test, the chest x-ray or all
17 three?

18 A. Well, all three because I would need some
19 more information. But I'm assuming that
20 all three would be back. Whatever time
21 they were all back, it was 45 minutes or an
22 hour, would be the time when I would be
23 prepared to make a phone call about ongoing

1 care for a patient that presented like
2 this.

3 Q. Would a failure to do that at that point in
4 time or very soon thereafter, Doctor, in
5 your opinion in this case deviate from an
6 ordinary and reasonable standard of care
7 for an emergency room doctor?

8 MR. COWDREY: Objection. You're
9 asking him to look at the ABG's in
10 this case and the chest x-rays, or
11 are you talking about a general
12 case?

13 Q. Do you understand the question, Doctor?

14 A. Yes, and I'm thinking what a good question
15 it is because it certainly deserves an
16 answer. And the reason that I'm thinking
17 about it is that I'm trying to make sure my
18 answer is right not for my emergency
19 department but for the general emergency
20 departments because we do things a little
21 bit differently here from other places.

22 I think that I have an answer. The
23 answer is that if the chest x-ray showed a

1 widened mediastinum, then any further delay
2 in calling would have been a deviation from
3 the standard because one needs to move
4 quickly if surgical repair is possible for
5 a ruptured aorta.

6 If you look at the chest x-ray and
7 it was normal, then I think it would be
8 perfectly reasonable to make decisions and
9 on any further intervention that could be
10 done by the emergency physician and take
11 some more time to see if more rapid
12 intervention would be reasonable.

13 The reason for that is that the
14 interventions that can be done in the first
15 instances are strictly surgical. The
16 scalpel is going to have to do that. The
17 interventions that can be done after that
18 are not surgical, and so depending on the
19 degree of experience and expertise of the
20 emergency physician, it would be quite
21 reasonable to say look at the film, decide
22 it's not an aorta, decide that it is a
23 contusion and go ahead with determining a,

1 how bad is this contusion, do I need to
2 repeat any tests, and then b, if those
3 tests confirm the initial impression or if
4 the patient's clinical course deteriorated,
5 then institute measures as we discussed
6 before, the intubation with PEEP, whatever
7 else might be necessary to control
8 palpations as they develop.

9 Probably not as good as a yes or no
10 answer, but I think --

11 Q. Not nearly. Doctor, let's look at the
12 blood gas, the first blood gas in this case
13 which I believe is 19A.

14 A. Thank you.

15 Q. Now, it indicates on Page 19A that that
16 blood gas was requested at 10:35 and drawn
17 at 10:40. So I think we're safe to assume
18 that this was the first blood gas after
19 arrival?

20 A. It sounds reasonable.

21 Q. Now you indicated that that was one of the
22 first things you would have done, along
23 with a chest x-ray and an EKG?

1 A. Right. Testing, I mean I was doing the
2 physical evaluation first, but you're
3 right.

4 Q. Right. All right, and let's assume this is
5 what you would have gotten back from the
6 lab.

7 A. Okay.

8 Q. Now how, Doctor, do you interpret or would
9 you interpret that first blood gas in this
10 set of circumstances?

11 A. Well, I would look at that and say this
12 doesn't look too bad because his oxygen
13 level is 60 and he is able to exchange
14 carbon dioxide well because it's normal and
15 so is the pH.

16 Then I would say, well, how much
17 oxygen did I have the patient on, and the
18 answer is 5 liters per minute. Did the
19 patient keep it on all the time or was he
20 pulling it off. Then I have to ask the
21 nurses about that and say -- and basically
22 say this isn't too bad. What we need to do
23 here is to monitor this case closely

1 because the patient looks a little bit
2 sicker, if any, than these show and try to
3 decide exactly what is it that's going on.

4 And perhaps the way to do that is
5 to do more blood gases, to repeat them to
6 make further decisions.

7 Q. All right. And in this patient and based
8 only on the circumstances we have at 10:40
9 with this patient, Doctor, how soon would
10 you do another blood gas?

11 MR. COWDREY: Objection. You're
12 assuming the blood gas result came
13 back to Dr. Myers at 10:40? Are
14 you asking him to assume that?

15 MS. STOCKLIN: I'm asking him to
16 assume the results of this blood
17 gas.

18 A. Okay, was it this patient or the
19 hypothetical patient we're talking about?

20 Q. This patient.

21 A. This particular patient? The answer to
22 that is how bad does the patient look in
23 another 10 to 15 minutes. If they look

1 terrible in 15 minutes or like they're
2 worsening, then that's when I do it. If
3 they look like they're getting better, I
4 would probably hold off a little while.

5 Q. Now, Doctor, in your opinion does the fact
6 that this man was having a respiratory rate
7 of 44, breathing 44 times a minute have any
8 relevance to the effectiveness of a nasal
9 cannula in this patient, in your opinion?

10 A. Well, it would depending on whether he's
11 breathing through his mouth or through his
12 nose. If he were mouth breathing, then the
13 inspired oxygen tension is a little bit
14 lower than if he's doing nasal breathing.
15 Because if it's nasal prongs, then you're
16 breathing through your nose and you tend to
17 suck in a little bit more oxygen than if
18 you're breathing through your mouth.

19 If you're breathing through your
20 mouth, you get kind of associated Venturi
21 effect, but the mouth is bigger than the
22 nose so the effect of the nasal oxygen is
23 fairly minimal breathing through the mouth.

1 The more anxious you are, the more
2 likely you are to mouth breathe.

3 Now that kind of question is one
4 that you needed to be there kind of
5 question, to actually see that person.

6 Q. Doctor, you also indicated that you would
7 do a 12 lead EKG and I think we know that
8 that was not done with this patient.
9 However, there was a rhythm strip, am I
10 correct?

11 A. Well, I don't know, I'd have to look
12 through that too. Could you tell me what
13 --

14 Q. Well, it looks like the first one that I
15 see is on Page 8.

16 A. I think I see the same one that you do.

17 Q. Now, it appears, Doctor, if I am correct,
18 and this was the first -- well, first of
19 all, let me ask you this. What is a 12
20 lead EKG going to be able to tell you as a
21 physician that a 1 lead rhythm strip will
22 not?

23 A. Whether or not there has been definite

1 evidence of injury to the heart muscle.

2 You can't tell that on a 1 lead.

3 Q. So this would be then in reference to the
4 suspected myocardial contusion in this
5 case?

6 A. Correct.

7 Q. And have very little to do with pulmonary
8 contusion?

9 A. Correct.

10 Q. Is the rhythm strip that we have examples
11 of in this chart going to help you in any
12 way if the injury is myocardial contusion?

13 A. Perhaps minimally so because it indicates a
14 rapid heart rate that you would expect some
15 rapidity of the heart rate. A rate of --
16 this one was read as 139 by the machine.
17 It's a little bit faster than you'd like to
18 see.

19 So it will give you some hint, but
20 in terms of relative value, this is
21 minimal. Keeping in mind that a negative
22 electrocardiogram is also consistent with a
23 myocardial contusion.

1 Q. A normal, is that what you're saying?

2 A. Yes.

3 Q. All right, Doctor, once you had seen a
4 chest x-ray in this patient and you had
5 seen at least the initial blood gas, what's
6 the next move?

7 A. I think in this particular patient I said
8 we would repeat the blood gas based on the
9 clinical condition.

10 Q. Well, the blood gas with this patient was
11 in fact repeated, a second blood gas being
12 drawn at 9:20, or something like that.

13 A. Eleven-twenty?

14 Q. I beg your pardon, 11:20. So we're talking
15 about 40 minutes after the first was drawn.

16 A. Is that 19B?

17 Q. Yes.

18 A. All right.

19 Q. And it appears from the slip that the
20 patient was on room air at that time,
21 right?

22 A. Yes, that's right.

23 Q. Well, now we know that Mr. Weaver was

1 pulling out some IV's and I believe nasal
2 cannula as well. In any event,
3 approximately 40 minutes later he was on
4 room air and apparently not receiving
5 oxygen at that time when this was drawn.

6 Now, Doctor, how do you interpret
7 the blood gas results that were drawn at
8 11:20?

9 A. The occasion is now assuming these are
10 arterial gases now, and assuming that this
11 indicates severe hypoxia and this level of
12 hypoxia is not consistent with it doing
13 well, as a matter of fact after a while
14 you'd die if you left it like this.

15 Q. Let's see, and we're talking about 11:20.
16 And my understanding is, Doctor, if this
17 patient was still up and walking around and
18 not talking, et cetera; is that correct?

19 A. I have to correlate that with the nurses'
20 notes, but I think that at that time he was
21 still moving around, that's correct.

22 Q. And, Doctor, what do you see as the
23 appropriate course of action in light of

1 the first two blood gases and all the other
2 circumstances that were going on which this
3 patient at approximately 11:20?

4 MR. COWDREY: Objection. Go
5 ahead and answer.

6 A. Good question. Can I interpret your
7 question to ask me again what would I do at
8 this point, or is your question -- well,
9 what was your question, I'm sorry?

10 Q. My question was, what in your opinion is
11 the appropriate action for this patient at
12 that point, for you as an emergency doctor
13 to take?

14 A. All right.

15 MR. COWDREY: Are you using the
16 word appropriate meaning what's the
17 standard of care for emergency room
18 physicians?

19 MS. STOCKLIN: Yes.

20 A. All right. I would have to look at two
21 potential things at this point. One is I
22 would want to decide whether or not this
23 blood gas with a high CO2 and a low O2 and

1 a pH which is somewhat acidotic and a low
2 oxygen saturation was indeed an arterial
3 gas, and so I wasn't there. And so either
4 the two things that could be done is if one
5 were convinced that it was arterial, then
6 it would be appropriate to take steps to
7 intubate the patient.

8 If one were not convinced it was
9 arterial, then it would be appropriate to
10 quickly repeat the gas and if it confirmed
11 this, then to take steps to intubate the
12 patient right then.

13 Q. So make sure this blood gas is giving you
14 legitimate results?

15 A. No, I say this is a judgment. And so the
16 physician would have to look at that and
17 say I think that this gas is a, completely
18 consistent with what I see, it must be
19 right, or b, I'm still not sure it's
20 consistent so before I get this guy who is
21 thrashing about and smash into his airway
22 potentially causing some other damage, I
23 want to double check, it's only going to

1 take a few more minutes.

2 I'm saying that either one of those
3 approaches would be consistent with the
4 standard of care. I would support either
5 one.

6 Q. Now, Doctor, it appears from this chart
7 that neither of those routes were taken
8 with this patient anywhere near 11:20,
9 11:30, 11:40; is that correct?

10 MR. COWDREY: Objection. We
11 don't know at what particular point
12 in time these results came back to
13 Dr. Myers.

14 MS. STOCKLIN: That wasn't my
15 question.

16 Q. Dr. Janiak, you've read all the
17 depositions of the Defendant doctors in
18 this case, and you've read the charge. Is
19 it a fair statement that neither one of the
20 options that you talked about were taken
21 with this particular patient any time
22 around 11:30 that night?

23 MR. COWDREY: I'm going to

1 object because Dr. Myers told you
2 in his deposition two things. One,
3 that he suspected that this could
4 be venous blood and secondly, that
5 he did not know the exact time that
6 these results came back to him from
7 the second blood gas study.

8 With that objection, go
9 ahead and answer, if you can,
10 Doctor.

11 A. Well, if we're going to look at the numbers
12 exactly, and we just make an assumption
13 that these numbers are really cast in
14 stone, then certainly intubation didn't
15 take place right then. As far as I
16 remember, there wasn't an immediate blood
17 gas, or there was another blood gas
18 ordered, but it certainly was not at 11 --
19 well, I can't read mine, but I think it is
20 11:30.

21 There is another blood gas that is
22 sort of confusing because it says time
23 drawn, 12 something, and the time received,

1 11 something. So I don't know what that
2 means, that probably refers to those
3 numbers on 19C.

4 MR. COWDREY: I think that,
5 Doctor, indicates time requested,
6 11:55 and time drawn, 12:10.

7 A. Is that requested?

8 Q. Yes.

9 A. I thought it was received. I apologize for
10 that. So another was drawn, it was not
11 drawn or requested immediately according to
12 the record.

13 Q. In your opinion, Dr. Janiak, was a
14 reasonable and ordinary standard of care
15 met with Mr. Weaver between 11:30 and 12
16 a.m. on this particular evening when he was
17 not intubated and another blood gas was not
18 requested during that half-hour period?

19 MR. COWDREY: Objection. I
20 think it indicates the request for
21 the third blood gas was 11:55, but
22 go ahead and answer if you can.

23 Q. With that correction, Doctor.

1 A. Yes, I think that's within the standard
2 because I really can't look at a patient
3 who's thrashing about like this and say
4 that I'm going to give, say that somebody
5 violated the standards for that few minutes
6 of time. It was done, and there were some
7 results that came back from that third set
8 of blood gases.

9 It was reasonable to want to repeat
10 them. There was a change in between those
11 two. I would think that the change was
12 that the patient was on room air and then
13 was placed at it looks like -- somebody
14 might help me, is that 6 liters per minute,
15 6.0 liters per minute? When you do that,
16 you have to give the patient a few minutes
17 to make an adjustment to that change. You
18 can't put them on -- change it from 0 to 6
19 liters per minute and then draw a blood gas
20 because the blood gases will be of no
21 value.

22 You have to give them -- oh, most
23 of us wait 10 minutes I suppose, and we'll

1 figure that there's been an effect, so
2 giving him those 10 minutes and then a
3 couple more minutes to reassess the
4 patient, I think that's okay.

5 Q. Well, then let's go to the next step, Dr.
6 Janiak, when the third set of blood gases
7 were drawn at 12:10 a.m. What do those
8 tell you?

9 A. This shows that one, the patient was on 6
10 liters per minute, the patient's oxygen
11 level had gone up slightly, but the CO2
12 level is higher and there is increasing
13 acidosis.

14 Q. What, Doctor, in your opinion would a
15 reasonable and ordinary standard of care
16 require with this patient regarding his
17 respiratory status after the third set of
18 blood gases?

19 MR. COWDREY: I'm going to
20 object because unless you're going
21 to ask him a question concerning
22 Dr. Myers or are you asking
23 reasonable standard of care for any

1 physician or emergency room
2 physician? Because as I've
3 indicated to you earlier, he's here
4 to express opinions concerning Dr.
5 Myers and I think the evidence is
6 clear that after 12 o'clock came
7 along, Dr. Myers wasn't necessarily
8 involved with this patient's care.
9 That objection --

10 MS. STOCKLIN: I was talking
11 about the standard of care required
12 for this patient under these
13 circumstances regarding his
14 respiratory status for any
15 physician.

16 A. Okay.

17 Q. Do you have an opinion?

18 A. Yes, I do.

19 Q. What is that?

20 A. At this point, the standard of care would
21 have been to aggressively intervene in the
22 airway with intubation and then assess what
23 that did, and take any other steps

1 depending on the results of what the
2 intubation did.

3 Q. In your opinion, Doctor, was the failure to
4 intubate this person until sometime after
5 12:45 in light of these three blood gases a
6 deviation from reasonable and ordinary
7 standards of medical care for this patient
8 for any position?

9 MR. COWDREY: Objection. Go
10 ahead and answer it.

11 MR. KRISHER: Same objection.
12 Note my objection.

13 A. You asked me, was this a deviation from
14 standard to not intubate at this point?

15 A. To not intubate until sometime after 12:45?

16 MR. COWDREY: Objection again.

17 MR. KIRSHER: Join in.

18 MR. MENZ: Note the same
19 objection.

20 A. What I think I was saying is that at the
21 time of the results of the 19C blood gases
22 were available, that that patient should
23 have been intubated then. What I was

1 saying was up until that time, it was not a
2 violation to not intubate, or withholding
3 intubation was okay.

4 After this set of tests, I'm saying
5 that the patient should have been intubated
6 and the people who did or didn't intubate
7 did not perform up to the standards of
8 care.

9 Q. I think I read you. Once this third set of
10 blood gases was in, then it became in your
11 opinion in order to meet a reasonable and
12 ordinary standard of medical care for a
13 physician, it became necessary to
14 immediately begin intubation; is that
15 correct?

16 A. That's right.

17 Q. Doctor, are you familiar with -- well, I
18 assume you are familiar with the advanced
19 trauma life support course and regarding
20 primary survey of a trauma patient?

21 A. I know what a primary survey is, but I have
22 not taken or given the advanced trauma life
23 support course.

1 Q. I guess what I'm asking you about is your
2 familiarity with that concept of a primary
3 survey on a trauma patient.

4 A. Yes, that's what I described to you
5 actually way back in this deposition when
6 we discussed that.

7 Q. Well, let's -- I will try not to be
8 redundant here, but let me ask you what
9 that means to you, that sense of a primary
10 survey. What's that mean?

11 A. It's extremely simple. A primary survey is
12 a quick evaluation of all the patient's
13 bodily areas excluding those which are not
14 going to be life threatening. For
15 instance, in a primary survey you would not
16 be real worried about a fractured finger,
17 so you're going to focus on the central
18 nervous system, the abdomen and the chest.
19 You want to know whether the patient's able
20 to breathe and what their vital signs are,
21 as opposed to secondarily when you go over
22 each area again in somewhat more detail.

23 So the primary survey is -- focuses

1 on the central body systems and is
2 relatively brief, and the secondary survey
3 is more in depth and basically looks at the
4 body again, but in a little more detail and
5 more complete.

6 Q. When you're teaching your residents,
7 Doctor, in the emergency room to deal with
8 trauma patients, what do you tell them as
9 far as what this primary survey should
10 consist of?

11 A. Well, I suppose the most important thing to
12 tell -- that we tell the residents
13 regarding the primary evaluation of the
14 patient is to keep it brief, keep it simple
15 and don't look for nonlife-threatening
16 potential problems, but look for the
17 problems that are going to be potentially
18 most severe to the patient.

19 Q. What are those?

20 A. Maybe I could give you an example. The
21 patient that arrives via a rescue squad on
22 a back board with a cervical collar in
23 place having been in an automobile accident

1 who is complaining of neck pain, the survey
2 should quickly make a determination that
3 yes, there is pain in the neck. I mean I
4 could touch the neck and it hurts, and the
5 patient obviously is breathing and
6 comfortable and not bleeding anywhere else,
7 let's go back and look at the neck in
8 detail radiologically.

9 Residents who look at the patient
10 in detail initially and order too much may
11 delay the appropriate care for that
12 potential problem which in the case I just
13 described is a neck fracture.

14 So you don't want the resident to
15 get too involved in the case until he or
16 she has focused in on that one -- on this
17 particular patient I described, the life or
18 limb threatening problem.

19 Q. All right, Doctor, now we know that certain
20 medications were administered to Mr. Weaver
21 dealing with this breathing problem he has
22 complained of, right?

23 A. Right.

1 Q. Do you know what those medications were?

2 A. I know at least one of them. I think he
3 had two, I think I remember Aminophylline
4 and I think at one point some Epinephrine
5 and obviously just the intravenous fluids
6 themselves. He had some Valium and some
7 Anectine and some physostigmine.

8 Q. Well, those last three, Doctor, came much
9 later after -- or during or after
10 intubation; is that correct?

11 A. Correct.

12 Q. All right, now I'm talking about initially
13 to deal with these --

14 A. Breathing problems.
15 -- breathing problems. And you mentioned
16 Aminophylline and Epinephrine?

17 A. Yes.

18 Q. I believe there were also some attempts at
19 Alupent breathing treatments?

20 A. Yes, I believe that was true.

21 Q. Now, Doctor, can you tell me what the
22 indications are for the use of Epinephrine?

23 A. Well, Epinephrine is used for -- to reverse

1 spasm in the lungs and to dilate the
2 bronchi, make breathing easier.
3 Epinephrine is used to reverse acute
4 allergic reactions, to prevent
5 cardiovascular collapse in most cases.

6 Epinephrine is used on wounds to
7 control bleeding. Epinephrine is
8 occasionally used to stimulate the heart if
9 it stopped, and it's used to increase blood
10 pressure, although we don't use it for that
11 very often.

12 It's unusual to use that anymore,
13 but it has been in the past.

14 Q. And, Doctor, what's the -- can you tell me
15 what the time frame is that it takes
16 Epinephrine to begin having an effect or
17 kick in?

18 A. Five minutes to 15 minutes, very quick. It
19 depends on how it's given, of course.

20 Q. Now, Doctor, I assume that you have dealt
21 with a number of trauma patients at Toledo
22 emergency room, and I'm assuming also that
23 you have had more than a number of

1 occasions to administer Epinephrine for one
2 reason or another.

3 A. Several thousand I would imagine.

4 Q. All right. Now, Doctor, when you consider
5 administering Epinephrine and let's say you
6 have an adult male black obese, known
7 hypertensive over age 45, are you going to
8 apply any restrictions to your use of
9 Epinephrine?

10 A. I think there is some literature about that
11 and some teaching that we should be more
12 cautious in the use of Epinephrine. I
13 certainly would not use as much as .5 cc's
14 on somebody like that. As a matter of
15 fact, personally I would use Terbutylene,
16 which is a drug similar to Epinephrine
17 but has less cardiac irritability than
18 Epinephrine.

19 So yes, there is a little bit of
20 caution in that. It's more often applied
21 to patients who are in their 60's or 70's,
22 but you certainly would think about it.

23 Q. All right, would you think about it further

1 if this particular patient had admitted to
2 the emergency room with a blood pressure of
3 220 over 140?

4 A. If the patient had come in with that blood
5 pressure and shortness of breath without a
6 history of trauma, you would think about it
7 a little further, that's right. With the
8 history of trauma and this condition, you
9 might not think about it quite so much, but
10 you certainly would.

11 I'm not trying to minimize that,
12 there is no -- there really is no time you
13 wouldn't want to think about that.

14 Q. Do you see any problem whatsoever, Doctor,
15 with administering Epinephrine to Mr.
16 Weaver under the circumstances of this
17 case?

18 A. No, I don't think so. It certainly would
19 cause more cardiac irritability than the
20 other drugs, but that doesn't mean there's
21 an incredibly high incidence. And this
22 patient was sick enough to make an attempt
23 to reverse his pulmonary problem.

1 Sometimes patients like this have
2 contusions to the lungs with primarily
3 bronchospasm. Other patients have just
4 bronchospasm and no contusion to the lung.

5 In that case, the patient', all the
6 other patient's symptoms can be relieved by
7 relieving the bronchospasm. And he may
8 need to do nothing more, so it's certainly
9 reasonable to try this.

10 Q. All right, this particular patient however
11 according to your opinion, Doctor, had a
12 myocardial contusion with cellular damage
13 to the heart; is that right?

14 A. That's right.

15 Q. Under those circumstances, along with a
16 pulmonary contusion is it still your
17 opinion that Epinephrine was an appropriate
18 drug to administer in this case?

19 MR. COWDREY: I'm going to
20 object because I think he's
21 indicated to you that it is his
22 opinion that the patient had a
23 myocardial contusion after seeing

1 everything in the case, and if
2 you're asking him at the time that
3 this patient was administered, the
4 medication, that's all well and
5 good. But I want to object to that
6 question as it is now phrased.

7 Go ahead, Doctor.

8 A. If I had seen this patient at 11:20 with
9 those conditions and there was a sign
10 tattooed on his chest that says warning,
11 myocardial contusion, then this would be
12 the wrong drug to use.

13 Q. It would be contraindicated, wouldn't it?

14 A. Yes, right. But at 11:20 that wasn't a
15 definitive diagnosis, and the patient was
16 having plenty of trouble breathing, had a
17 heart rhythm which was sinus and rapid, but
18 certainly not irregular and was not
19 complaining of chest pain so therefore
20 trying to relieve the bronchospasm was very
21 reasonable.

22 As a matter of fact, I believe the
23 original record said expiratory wheezes.

1 So that's an appropriate treatment for
2 that.

3 Q. Dr. Janiak, would you agree that hypoxia
4 itself can result in restlessness in a
5 patient, combativeness and confusion?

6 A. Yes.

7 Q. Doctor, do you have any opinion at all as
8 to whether this particular patient who
9 presented under the circumstances he did
10 should have been permitted to walk around
11 the emergency room?

12 A. I have a -- yes, I have an opinion about
13 that.

14 Q. What is that?

15 A. Initially I think in order to decrease the
16 patient's anxiety, it would not have been
17 appropriate to restrain him right after he
18 walked in the door. You need to get some
19 sense of the history of the physical and a
20 couple of laboratory results.

21 I think it's okay to have patients
22 move around in a semi-controlled situation
23 until you get some sense of where you are.

1 Now the next question is, well, when would
2 you get that sense? And that is really a
3 judgment -- I don't know, the judgment is
4 up to the physician who's watching the
5 patient. The variables are more than you
6 and I could discuss if we were here for the
7 rest of our lives.

8 It's just that sense of seeing the
9 patient. There is no question, however,
10 that at some point the patient will
11 continue to pace, in this case, would have
12 needed to be restrained and intubated, even
13 against his will.

14 Q. Would you be comfortable in saying, Doctor,
15 and would it be fair to say that certainly
16 by 12:15 a.m. when Dr. Keighley arrived
17 this patient should no longer have been
18 walking around the emergency room?

19 MR. COWDREY: Objection. I
20 don't know that we have any
21 evidence that the patient was
22 walking around the emergency room
23 at 12:15 or Dr. Keighley got there.

1 and again Dr. Janiak's here to
2 testify concerning Dr. Myers and
3 not Dr. Keighley or Dr. Rank.

4 Go ahead and answer if you
5 can, Doctor.

6 A. Well, I would but I'm not sure I can answer
7 that because I'm not sure what the patient
8 was doing right then. I think that a
9 second physician has to evaluate the same
10 patient, he deserves a few minutes to make
11 up their own minds and it would have been,
12 I think, inappropriate for Dr. Keighley to
13 come down and as a first step say, restrain
14 this patient and now we'll do something.

15 I think he'd have to go through his
16 own brief assessment and then make a
17 decision. Now whether that decision would
18 have been at 12:17 or at 12:51, I can't
19 answer that question.

20 Q. Well, Doctor, let's not talk about Dr.
21 Keighley particularly, let's talk about the
22 time frame between 10:30 when this patient
23 arrived in the ER and 12:15, and knowing

1 what you know from your review of the chart
2 and what took place during that time
3 period, is it fair to say that by 12:15, if
4 not much earlier, this patient should have
5 no longer been allowed to walk around the
6 emergency room?

7 MR. COWDREY: I'm going to
8 object because I think he's
9 indicated to you that that's a
10 judgment call and the physician
11 that's reviewing that particular
12 patient. He indicated there's a
13 lot of factors and variables.

14 Go ahead and answer if you
15 can, Doctor.

16 A. No, I don't think that's fair, and the
17 reason for that is that one of the things
18 you -- one of the reasons this patient is
19 pacing is he is so anxious, and you have to
20 ask yourself is the pacing itself harming
21 the patient significantly? Now certainly
22 because the pacing uses up oxygen, it is
23 harming the patient some in this particular

1 patient.

2 Is that significant or will
3 restraining him make him so anxious that
4 his blood pressure will go up 30 more
5 points and his respiratory rate will go up
6 10 more points and will consume more oxygen
7 just because he's anxious, which happens,
8 it absolutely happens.

9 So you have to make a judgment on
10 that as to whether or not you need to have
11 that patient restrained. One of the
12 judgment factors is what can I do to him
13 while he's moving about that I -- or what
14 can I do to him that if I restrain him that
15 I can't do to him while he's moving about.

16 Will he tolerate the Alupent
17 treatment or does he throw it away? Will
18 he leave the IV in long enough for me to
19 get some medicine in it or does he keep
20 ripping it out every single time I do it?

21 If the answer is that you can't
22 even get to the patient because he's pacing
23 about and can't intervene pharmacologically

1 in any way, that patient needs to be
2 restrained.

3 If you can get to him some of the
4 time and get some of the medicine into him
5 enough to decide that that's enough, which
6 is one of those judgments, then let him
7 pace for a little while.

8 Unless you think he's got a broken
9 neck, there's no need to have to tie him
10 down.

11 Q. Dr. Janiak, you indicated to me earlier on
12 this deposition that Mr. Weaver's injuries
13 were so severe at the time of this accident
14 he was a doomed man to die from those
15 injuries?

16 A. That's right.

17 Q. You have also indicated to me that the
18 three blood gases that were accomplished by
19 12:15 that morning indicate a profound,
20 severe hypoxia and acidosis?

21 A. Correct.

22 Q. You have also indicated to me that you are
23 aware that this man was pulling out IV's

1 and pulling off his oxygen mask, nasal
2 cannula, et cetera. Would you agree as
3 well that the blood gases indicate that he
4 was not getting the benefit of oxygenation
5 at any time prior to 12:15?

6 A. No.

7 Q. You would not?

8 A. No.

9 Q. He was getting the benefit in your opinion
10 of some oxygenation, then?

11 A. I don't know whether he was or he wasn't.
12 I guess what I'm saying when I answer it so
13 emphatically no is that he could have had
14 all the oxygenation in the world, and the
15 blood gases could still have been the way
16 they were. It depends on the severity of
17 the injuries.

18 Q. I guess what I'm failing to understand, Dr.
19 Janiak, is a man with this severe of
20 injuries and this dismal looking blood
21 gases at 12:15 in the morning is fine to be
22 up walking around the emergency room. I
23 have problems reconciling that. Is that

1 your opinion?

2 A. I missed that. Is my opinion that it's
3 okay for him to walk --

4 Q. Under these circumstances, it's all right
5 for him to walk around the emergency room?

6 A. Yes, because my opinion is is that that is
7 a judgment that they made, and I don't see
8 anything in the standards that say that you
9 can't make that judgment for a patient like
10 this.

11 You have to be very flexible and
12 treat each patient a little differently.
13 If you could -- if somebody could indicate
14 to me that keeping him flat and tied down
15 was going to reduce his oxygen demand more
16 than letting him pace and be anxious, you
17 know, that would be fine. But I don't see
18 where that act of letting him do that hurt
19 him. I don't see the documentation that
20 that was what was causing his problem.

21 His problem was caused by an
22 extremely severe lung injury with a cardiac
23 injury also.

1 MS. STOCKLIN: Let me take five
2 minutes. I think I just have a few
3 more questions.

4 (A short recess was taken.)

5 Q. Doctor, it's just going to be a short
6 while. I just have a few more questions.
7 If you were to fill out the death
8 certificate on Mr. Weaver after reviewing
9 this case and all the medical records and
10 depositions that you have reviewed, how
11 would you fill it out?

12 MR. COWDREY: Objection, go
13 ahead and answer.

14 A. Well, you know, I don't fill those out, but
15 I would say what I've been saying all
16 along, is the patient died of a contusion
17 to his heart and his lungs.

18 Q. And that's it? I mean, would that be the
19 entire --

20 A. That would be it.

21 Q. Doctor, which of the hospitals in Dayton,
22 Ohio does your corporation have a contract
23 with to do the billing?

1 MR. COWDREY: Objection, assumes
2 it does. But go ahead.

3 Q. For emergency services?

4 A. The billing company?

5 Q. Yes, I'm sorry. I switched gears --

6 A. That's all right, that's okay. I'm just
7 trying to catch up with you, that's all.
8 Miami Valley and -- you think I should know
9 these things but I really don't look at the
10 companies. I think we had a -- we don't
11 have a specific contract with St.
12 Elizabeth, that's why I'm trying to be
13 accurate. I think we can get some money
14 for the billing at St. Elizabeth's through
15 another company which are not related, so I
16 don't think we have a contract with St.
17 Elizabeth's.

18 But we do have one with Springfield
19 Physicians, which is near Dayton. So
20 really the only contract in Dayton is with
21 Miami Valley Hospital Emergency Physicians,
22 I forget their name.

23 Q. Well, even though you're talking about

1 contract, do you do any of the billing or
2 provide any of the services for any other
3 emergency rooms in Dayton?

4 A. None other than what I have already
5 mentioned.

6 Q. I assume then that you are involved with
7 the billing for TMES out of Grandview or
8 Southview Hospital?

9 A. No. As a matter of fact, I asked earlier
10 when I had forgotten that those were in
11 Dayton, I thought maybe Columbus.

12 Q. Doctor, are you prepared today to offer any
13 opinions regarding whether or not Dr.
14 Keighley or Dr. Rank met ordinary and
15 reasonable standards of care in their
16 treatment of Mr. Weaver?

17 A. No, I'm not going to comment on that.

18 Q. You're not prepared to make any comments?

19 A. Right.

20 Q. And do not intend to at trial?

21 A. Not at this time; no, I do not.

22 Q. All right.

23 MS. STOCKLIN: I think that's all

1 the questions I have for you today,
2 Dr. Janiak. I would only request
3 that should you make any additions
4 or changes in your opinions, that
5 you notify Mr. Cowdrey of that so
6 that I can be notified of that
7 prior to trial.

8 THE WITNESS: That would be more
9 than fair. I promise.

10 MS. STOCKLIN: Thank you.

11 MR. COWDREY: I assume that you
12 two gentlemen don't want to ask any
13 questions; is that correct?

14 MR. KRISHER: Yes, that's
15 correct.

16 MR. MENZ: That's correct.

17 MR. COWDREY: We will submit the
18 deposition to the witness for
19 review and signature.

20 MR. KRISHER: I would like a
21 copy of it.

22 MR. MENZ: I would also.

23 MR. COWDREY: And I'll take a

1 copy. I assume you want the
2 original?

3 MS. STOCKLIN: Yes, I'd like the
4 original.

5 (The deposition was concluded at
6 4:35 o'clock p.m.)
7
8

17) SS.
18 COUNTY OF LUCAS)

19 I, Jane Beckett, a Notary Public in and for
20 the State of Ohio, duly commissioned and
21 qualified, do hereby certify that the within-named
22 witness, BRUCE DAVID JANIAC, M.D., was by me first
23 duly sworn to tell the truth, the whole truth, and
nothing but the truth in the cause aforesaid; that

GAINES REPORTING SERVICE, INC.

317 SUPERIOR ST. - TOLEDO, OHIO 43604-1472

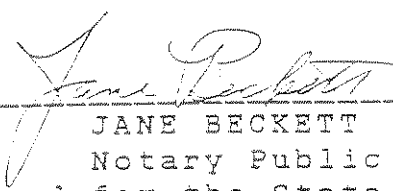

(419) 243-4251

1 the testimony then given by him was by me recorded
2 by audio tape in the presence of said witness,
3 afterwards transcribed upon a word processor, and
4 that the foregoing is a true and accurate
5 transcription of the testimony so given by him as
6 aforesaid.

7 I do further certify that this deposition
8 was taken at the time and place in the foregoing
9 caption specified and was completed without
10 adjournment.

11 I do further certify that I am not a
12 relative, counsel, or attorney of any party or
13 otherwise interested in the event of this
14 action.

15 IN WITNESS WHEREOF, I have hereunto set
16 my hand and affixed my seal of office at Toledo,
17 Ohio, on this 3rd day of October, 1989.
