COPY

Washington, District of Columbia

Tuesday, November 26, 2002

Deposition of:

RAOUL L. WIENTZEN, JR., M.D.

A witness, called for examination by
counsel for the plaintiffs, pursuant to notice, at
1522 K Street, Suite 720, Washington, DC 20005,
beginning at 9:30 a.m., before JOSEPH A. INABNET, a
Court Reporter, when were present on behalf of the
respective parties:

1 FOR THE PLAINTIFFS:

2 JEFFREY E. SCHOBERT, ESQ.

Hanna, Campbell & Powell

3 3737 Embassy Parkway

Akron, Ohio 44334

4 (330) 670-7300

5

6 FOR THE DEFENDANTS:

7 DANIEL FINELLI, ESQ.

RONALD A. MARGOLIS, ESQ.

8 Finelli & Margolis CO LPA

12 C O N T E N T S

13 WITNESS: RAOUL L. WIENTZEN, JR.

14 EXAMINATION BY MR. SCHOBERT 3

15

16 E X H I B I T S

17 NUMBER: MARKED FOR IDENTIFICATION:

18 Deposition Exhibit No. 1 89

19

20

21

22

1 P R O C E E D I N G S

2 (The witness was duly sworn by Tom
3 Olender, a notary public for the District of
4 Columbia.)

5 Thereupon,

6 RAOUL L. WIENTZEN, JR., M.D.

7 A witness, called for examination by
8 counsel for the plaintiffs, having been first duly
9 sworn by the notary public, was examined and
10 testified as follows:

11 EXAMINATION

12 BY MR. SCHOBERT:

13 Q. Doctor, would you please state your full
14 name for the court reporter.

15 A. My name is Raoul L. Wientzen, Jr., M.D.

16 Q. Doctor, have you previously had your
17 deposition taken?

18 A. Yes.

19 Q. Can you give me some idea how often that
20 has occurred?

21 A. I think in the last five or six years,
22 probably four or five times a year, prior to that,

1 less frequently.

2 Q. Have these depositions over the last
3 number of years, have they been primarily involved
4 in the medical legal matters such as we are here
5 for today?

6 A. Yes.

7 Q. Obviously then you understand the nature
8 of a deposition and know the instructions in terms
9 of if you don't understand my question, please let
10 me know. Don't answer the question.

11 And because of the medium we are
12 utilizing here today, it is always good if we wait
13 an extra second between responses to each other
14 because I think sometimes we can overlap, and it is
15 difficult. Okay?

16 A. Fair enough.

17 Q. Doctor, do you have a current CV with you
18 today?

19 A. No, I'm sorry. I did not bring a CV. I
20 came from my home rather than my office this
21 morning, but I can get one to Mr. Finelli or
22 Mr. Margolis.

1 Q. Would you do that, sir, provide them an
2 updated CV?

3 A. Sure.

4 Q. Let me ask you this just generally.
5 Can you tell me where you did your
6 medical school?

7 A. Yes. I went to medical school at
8 Georgetown University School of Medicine, 1968
9 through '72.

10 I then did three years of pediatric
11 residency, also at Georgetown, left to go to
12 Dallas, Texas where I did a two-year pediatric
13 infectious disease fellowship at the University of
14 Texas, Southwestern Medical school from 1975 to
15 1977.

16 And then in 1977, I returned to
17 Washington where I entered the full-time faculty at
18 Georgetown University Medical School.

19 Q. Okay. You say that you did your
20 fellowship at the University of Texas Southwest
21 Medical School. Is that correct?

22 A. Yes.

1 Q. Who was the chairman of the department
2 there when you completed your fellowship?

3 A. When I completed my fellowship was Heinz
4 Eichenwall (phonetic), chairman of the department.

5 Q. Doctor, I assume that you have published.
6 Is that an accurate statement, that you
7 have authored peer review journal articles and/or
8 text material?

9 A. Yes, I have.

10 Q. Is that a fair statement?

11 A. Yes.

12 Q. Has anything that you authored would you
13 consider to be on point or -- to any of the issues
14 that we are here to discuss in this particular
15 case?

16 A. Yes.

17 Q. Can you give me some identification. I
18 do not have a copy of your CV in front of me.

19 I may have been provided it. I have your
20 report, but I don't have the CV. So I guess I need
21 some way to determine what articles may be on
22 point.

1 A. Okay.

2 Q. Or perhaps we could agree that if you
3 provide a CV to Mr. Finelli --

4 A. That's fine.

5 Q. -- or Mr. Margolis, that you could circle
6 those peer review journals and/or tech materials as
7 to ones you think have some relevancy to the
8 subject matter of today's discussion, that would
9 save us some time.

10 A. That would be fair. I will be happy to
11 do that.

12 Q. In a very generic sense, is there a
13 particular area that you have concentrated your
14 writings on that would be germane to any of the
15 issues in this case?

16 Have you looked at GBS infections? Have
17 you looked at GBS meningitis, that kind of thing?

18 A. Yes, I have. My CV will show some
19 articles where have I published on a model of Group
20 B strep sepsis, a clinical series of babies with
21 neonatal bacterial sepsis and meningitis, which
22 includes Group B strep. It's the most predominant

1 cause when I wrote that article.

2 Some monographs that deal with neonatal
3 infection, so there would be several that focus on
4 Group B strep.

5 That has not been the focus of my
6 research as an academic faculty member, but it has
7 been one of the components of my academic
8 endeavors.

9 **Q. Is there one area that you would say has**
10 **been the primary focus of your academic endeavors**
11 **in that regard, some area you have spent the**
12 **majority of your time researching and writing**
13 **about?**

14 **A. I think it would probably be**
15 **streptococcal infections in general.**

16 Group B strep is a streptococcal
17 infection, but I have done work on pneumococcal
18 disease, which is streptococcus pneumoniae, Group B
19 strep, which is streptococcus agalactiae, and Group
20 A strep, which is streptococcus pyogenes.

21 And then lastly I have done some basic
22 science work on the streptococcal species that

1 inhabit the mouth and how human beings become
2 immune to those organisms.

3 So strep in general, but not a focus on
4 only one variety of strep.

5 Q. All right. Thank you.

6 Board certifications in what area or
7 areas?

8 A. Sure. Pediatrics in 19, I think, 78, and
9 then pediatric infectious diseases in 1994, which
10 was the first time the test was offered, and then
11 recertification in pediatric infectious disease
12 seven years later.

13 Q. All right. Now, going back to my
14 original question to you about prior involvement,
15 in medical legal matters, to your knowledge have
16 you been asked to give opinions in a deposition
17 format and/or at trial in issues similar to what we
18 have here in this case, a child that ultimately has
19 diagnosed a GBS infection at the time of delivery?

20 Have you given opinion testimony in that
21 area with that as a part -- at least part of the
22 fact pattern?

1 A. I'm sure that Group B strep as a disease
2 has been part of the cases that I have given
3 testimony in.

4 I'm not sure there has been a case that
5 parallels this case very closely wherein the
6 question is did the Group B strep cause the brain
7 damage or not.

8 Q. All right. Why don't you give me -- and
9 I'm assuming you have been asked this question
10 before when you have been involved in medical legal
11 matters.

12 Give me some idea as to the breakdown in
13 terms of the requests that are made either by
14 plaintiff or defendant, first of all. Let's talk
15 about that.

16 A. Sure. Probably two-thirds of the cases I
17 do are defense cases, and about one-third are
18 plaintiff's cases.

19 Q. To your recollection, have you provided
20 any the testimony in defense cases that arise from
21 medical care rendered in Ohio?

22 A. I don't recall any. I may have, but I

1 don't recall any.

2 Q. All right. Do you recall being involved
3 in any case where the care at issue is rendered in
4 Ohio?

5 A. I think years ago there was a case from
6 Ohio that dealt with recurrent pyelonephritis in a
7 baby that then got older, and that child then lost
8 kidney function on one side.

9 And I believe the case was from Ohio, but
10 I'm not absolutely certain.

11 Q. Okay. How often have you been asked to
12 do what we are doing today, which is to give
13 deposition testimony pursuant to opinions that you
14 have arrived at?

15 A. Well, as I said before, I think you had
16 asked me that question. I think it is four or five
17 or six.

18 Q. I'm sorry. I did ask you that question.
19 Let me back up.

20 How often are you just asked in general
21 to review cases?

22 You told me how often you are deposed.

1 I'm sorry. I apologize for that.

2 A. Probably I review a dozen or 15 cases a
3 year.

4 Q. Okay. Doctor, in your report -- I have a
5 report in front of me, first of all, of October 4,
6 2001.

7 Do you have a copy of that report?

8 A. I do.

9 Q. Is that the only report that you have
10 generated in this case?

11 A. Yes, it is.

12 Q. Have you at any point made any notes from
13 any review of any materials that you have been
14 supplied either prior to the writing of this report
15 or subsequent to the writing of this report?

16 A. Yes.

17 Q. Okay. Do you have those notes with you?

18 A. I do.

19 Q. All right. Generally, what are we
20 talking? About one page? Multiple pages?

21 A. Actually, it is on the cover letter from
22 Mr. Finelli sending me the records, that I made the

1 notes on the back of that sheet that deal with
2 events taken from the medical record.

3 And then on the front of that was a sort
4 of short summary of some of the issues that I had
5 opinions about in the case.

6 Q. All right. Could we -- first of all, in
7 a very general sense, is your handwriting the type
8 that most people can read, or are you like me; most
9 people cannot read your handwriting?

10 A. I think my handwriting would be
11 challenging for most people to read.

12 Q. Why don't we --

13 A. Sometimes it's challenging to me to read.

14 Q. How extensive is the writing say on the
15 front page where you kind of summarize the issues
16 of the case after you had gone through some of the
17 medical records?

18 A. Nine or ten lines.

19 Q. All right. Let me -- I will ask you in a
20 moment to maybe just read that real slowly for the
21 court reporter's sake, but let me just establish
22 this right now.

1 Were these comments that you have written
2 done at the time you completed your initial review
3 and prior to authoring your October 4, 2001 letter?

4 A. These comments of my opinions were
5 written after I did my initial review and before I
6 wrote the letter.

7 Q. All right. Since authoring the letter,
8 have you made any other written -- you know, made
9 any other notes or put any entries into any kind of
10 computer or anything else pursuant to other
11 materials you may have been sent?

12 A. Yes. The only additional notes I made
13 was over the last several days as I re-reviewed the
14 original medical records, I added to the backside
15 of the letter more facts about the unfolding of the
16 clinical events of the baby.

17 No opinion facts -- or no opinions
18 rather, but just dates and times and numbers and
19 things like that on this side of the record -- of
20 the letter.

21 Q. And that would then comprise all the
22 written notes that you have made at any time

1 leading up to today?

2 Is that a fair statement?

3 A. Well, I put a note on the top of another
4 letter, "Get CV and circle sepsis articles."

5 So I did do that note, but that's the
6 only other note that I made.

7 Q. Okay. Let's go ahead then, Doctor, and
8 if you would try to read at a measured pace so the
9 court reporter doesn't get angry at either one of
10 us your opinion comments that you have made on the
11 one side of that page.

12 A. Okay. I wrote, This baby really did have
13 Group B strep sepsis and this in association with
14 the last in utero hours caused asphyxia, but the
15 variety of sepsis post birth was mild.

16 And then I have a hyphen, Rapid recovery
17 of cardiovascular function without DIC, without
18 shock.

19 And then I have written, If somehow the
20 baby had been delivered earlier by plus/minus six
21 hours, the Group B strep sepsis (if it even existed
22 then) would not have been a damaging event.

1 Then lastly I have written, Antibiotics
2 were given by the OB timely (negative Group B strep
3 screen, no fever until 4:25 a.m.)

4 They are my notes.

5 Q. Doctor, again, my ability to write is
6 somewhat impaired by as quickly as you read, but
7 that first set of comments that you read to me,
8 could you re-read that just one more time?

9 A. Sure.

10 Q. Something about baby had GBS sepsis?

11 A. Right. This baby really did have Group B
12 strep sepsis, and this in association with the last
13 in utero hours caused asphyxia, but the variety of
14 sepsis after birth was mild.

15 And then I have the reasons for my
16 thinking that it was mild.

17 Q. Okay. Thank you, Doctor.

18 Going to the other side of the page then,
19 again, is that a pretty extensive amount of notes
20 that you have there?

21 A. Yeah.

22 Q. I don't want to take a long time reading

1 it, but go ahead. How extensive is it?

2 A. It's basically a whole page with numbers
3 and dates and times. I would be happy to read it.
4 It wouldn't make much sense, I think, if you take
5 it out of context of knowing what the case is
6 about, but I'm more than happy to read it. It
7 would take five minutes.

8 Q. What about the notes you said you wrote
9 in the last few days in preparation for getting
10 ready for today's deposition?

11 How extensive are those notes?

12 A. That's about maybe half of what is on
13 this page.

14 Q. Why don't you read those for me, if you
15 would, please?

16 A. Sure.

17 Q. Just those things that you have written
18 in the last few days, that you have gotten.

19 A. I can tell what I have written in the
20 last few days because it's in blue ink, whereas the
21 original stuff I wrote is in black and red ink.

22 So I'll read you the blue ink.

1 I have ABG 6:21 a.m. 8/4 7.13.

2 PCO2 21.

3 PO2 77.

4 Bicarbonate 6.7.

5 I have normal saline, 440 ccs times 2.

6 5 percent abumen 40 ccs 6 a.m.

7 7 ccs sodium bicarbonate 6:40 a.m.

8 Next to the normal saline 40 ccs times 2,

9 I have the times, 5:37 and 5:42 a.m.

10 Then I have, Transfer note: Heart rate

11 150, good respiratory effort, seizures q 2 minutes.

12 Heart rate 140, respiratory rate 64. Blood

13 pressure 64 over 33, mean 45, capillary fill time

14 less than three seconds.

15 Then I have -- next to 8/4, I have

16 PIP14/PEEP 4. That's PEEP 4. Rate 20. No ARDS on

17 admission. IV at 50 ccs per kilo per day.

18 Then underneath the date 8/5, I have

19 written capillary fill time 2 to 3, pulses 2+/4+.

20 D10 1/5 normal saline. 12 ccs an hour,

21 maintenance fluid.

22 I have 8/6, MAP 43 to 47. CFT less than

1 three seconds. Pulses 2+/4+.

2 I have 8/7, room air, will not extubate
3 because of question ability to handle secretions.
4 CFT less than 3. Mean BP 36 to 48. Pulses 2+/4+.
5 Transfuse for hematocrit, 26.

6 So they are the additions recently made
7 to the notes originally made.

8 Q. And if we could then hand that document,
9 either now or at the conclusion of the depo, to the
10 court reporter, we will ask her to mark that as
11 Exhibit A and ask that she --

12 A. Let's not get sexist.

13 Q. Excuse me?

14 A. It's a man. It's a male court reporter.

15 Q. Oh, I'm sorry. I apologize for that
16 misstatement -- ask that he make a copy of your
17 notes both front and back, and then we will attach
18 it to your deposition. Okay?

19 A. Good.

20 Q. Now, let me ask you then, according to
21 your October 4, 2001 report, you have, it says,
22 reviewed Akron General medical records and Akron

1 Children's Hospital records; correct?

2 A. Correct.

3 Q. Since that time, what additional
4 materials have you been provided for review?

5 A. I have three depositions, that of
6 Dr. Ferris, and Dr. McKelvey, and that of
7 Ms. Tarle, and then a series of opinions from
8 various experts, which include Louquette
9 (phonetic), Sweet, Hayashi, Keogh, Devoe, Painter,
10 Simpson, Rayburn.

11 And I think that's it.

12 Q. Is that all the materials then that you
13 had a chance to review there, or you have some more
14 there?

15 A. It is all of the materials that I could
16 find, so I reviewed what I could find.

17 Q. Doctor, did you review any radiology
18 studies of Mackenzie Tarle?

19 A. I didn't look at any films.

20 I read what was in the record as to the
21 interpretation of the films as they were done.

22 Q. And my assumption is you have not taken

1 it upon yourself to look at any placental
2 pathology.

3 A. Correct.

4 Q. That would be outside of your expertise.

5 A. Correct.

6 Q. Is that a fair statement?

7 A. Correct.

8 Q. All right. Doctor, having gone through
9 that list of expert reports, do you recognize any
10 of those individuals who authored any of those
11 reports? I mean, are they people that you, from a
12 professional standpoint, you know, know or are
13 aware of?

14 A. I'm aware of one name only, and that's
15 Dr. Sweet's name.

16 I don't know him personally, but I'm sure
17 I have read some of his writings.

18 Q. Okay. Is there any materials that you
19 believe you have not yet had the opportunity to
20 review that you need to review for any opinions you
21 may be providing in this case?

22 A. I don't think so.

1 Q. Doctor, having reviewed your report, is
2 it accurate for me to conclude that you are not
3 being -- or going to render any opinions on the
4 standard of care by the obstetricians that cared
5 for Ms. Tarle in this case?

6 A. That's correct.

7 Q. Having had the chance to review your
8 report and knowing that you have gone back again to
9 relook at the records, made some additional
10 notations about findings in the records that you
11 thought might be relevant, is there anything in
12 this report of October 4 that you would want to
13 change in any way?

14 A. No. I think what I have written in this
15 report still is accurate.

16 Q. All right. Doctor, did you do any review
17 of any literature for purposes of preparing this
18 report or preparing for your deposition today?

19 A. No, I did not.

20 Q. Okay. Outside of what you yourself may
21 have authored, contributed to, which we just very
22 basically discussed at the beginning of this depo,

1 is there any particular author or institution or
2 journal writer or anybody that you would go to look
3 at if you were concerned about issues of a GBS
4 sepsis had occurred in utero and what effect it may
5 have on the neurological status of that child after
6 delivery?

7 A. Well, I think I would -- I think there is
8 a huge body of literature on Group B strep sepsis,
9 some of which I have written myself.

10 Probably the sentinel work came from
11 Houston, Texas, Carol Baker's group. So I
12 probably, if I had the need to, would review some
13 of her writings about Group B strep.

14 Q. When were those writings -- to your
15 knowledge, when were those writings authored and
16 put into the general body of knowledge?

17 A. Over the last 30 years, since the early
18 '70s when Group B strep became a common clinical
19 problem confronting pediatricians, that's when the
20 research really began and that's when the data set
21 that we now have has been accumulated.

22 Q. Doctor, are you aware or do you know a

1 Dr. Jeffrey Perlman or a Dr. Shalak, S-H-A-L-A-K,
2 or Dr. Laptook, L-A-P-T-O-O-K --

3 A. I know none of those.

4 Q. -- Dr. Geoffrey?

5 A. No, I do not know those doctors.

6 Q. All right. Doctor, would you agree there
7 is an increasing evidence supporting an association
8 between placental infection information in term
9 infants and the development of cerebral palsy in
10 early childhood?

11 A. I think there are some data on that
12 issue, and I think I could probably answer your
13 question affirmatively, that there is increasing
14 data trying to link that condition to cerebral
15 palsy in childhood. I don't think the data is yet
16 complete or convincing, but there is publication on
17 that particular issue.

18 Q. All right. And are you aware of
19 particular institutions or authors or people that
20 are attempting to investigate that link between
21 those two things, placental infection and
22 neurological outcomes, including cerebral palsy?

1 A. Yeah. I have read some of the authors.

2 I know one is Dr. Nelson, but I couldn't tell you
3 the rest of the people involved in that research.

4 I have read those papers over the years.

5 **Q. All right. What is your understanding in**
6 **terms of the linkage that they are trying to**
7 **determine if it exists between those events in**
8 **terms of the path of physiology of that?**

9 A. Well, I think the theory is this, that we
10 know -- and it's now generally accepted that much
11 of the damage that infection causes comes about
12 because of the production of chemicals called
13 cytokines in response to bacterial cell wall
14 products of various kinds. And that it's the
15 cytokines that drive the septic shock syndrome, and
16 it's the cytokines that cause vascular injury.

17 So in patients with sepsis, you know,
18 adult patients, pediatric patients with sepsis,
19 it's really the cytokines produced by the patient
20 himself that causes the individual to go into
21 septic shock.

22 So the theory behind the cytokine

1 chorioamnionitis issue is are cytokines produced in
2 that disease, do they get into the baby, do they
3 circulate, do they cause vascular injury, and does
4 it cause brain damage and maybe even other organ
5 damage.

6 That to me is the, you know, the heart of
7 that research.

8 Q. All right. Have you yourself formed an
9 opinion as to whether or not you believe that that
10 process does in fact exist under those
11 circumstances whereby there is documentation of a
12 chorioamnionitis and ultimately a diagnosis of
13 neurologic injury such as cerebral palsy in a
14 child.

15 MR. MARGOLIS: I'm objecting. Is this a
16 term baby?

17 BY MR. SCHOBERT:

18 Q. In a term baby. That's fine. In a term
19 baby.

20 A. I don't think the data is convincing to
21 me right now that there is a link between
22 chorioamnionitis in a term baby or in a mother who

1 is going to have a term baby that day and
2 subsequent neurologic injury, such as cerebral
3 palsy in a term baby.

4 I think there is some data though that is
5 imperfect, and who knows what ten years will bring.
6 But right now I think it is not accepted, at least
7 in the field of pediatric infectious disease, as a
8 direct cause-and-effect link.

9 And I say that for many, many reasons,
10 one of which is often, in at least the data that I
11 can recall, there are other factors of the baby's
12 birth and delivery and subsequent neonatal events
13 which in and of themselves are known to cause
14 cerebral palsy, such as birth asphyxia, such as
15 severe respiratory distress and bad hypoxia, such
16 as severe septic shock.

17 I mean, there are many things that go
18 hand in hand with chorioamnionitis that intervene
19 between then and when you make a diagnosis of
20 cerebral palsy in an individual.

21 So I think the data is very imperfect. I
22 think it's fascinating data, but at this point

1 imperfect. And it is a theory, not a proven
2 cause-and-effect event.

3 And then lastly, I would have to say that
4 chorioamnionitis to some degree is so common that
5 there is going to have to be many babies born to
6 ladies with chorioamnionitis who don't develop
7 cerebral palsy.

8 And what you really need to identify is
9 what is it about the small fraction of babies with
10 chorioamnionitis and cerebral palsy that allows
11 that to happen, if it happens.

12 Q. Let me follow up.

13 In terms of this concept of cytokines in
14 a pediatric or adult population, do you believe --
15 is it your opinion that cytokines have been proven
16 to exist and, you know, the path of physiology you
17 have described to me, you know, does exist in a
18 pediatric population and/or an adult population?

19 MR. MARGOLIS: And I apologize. Again, I
20 object to the "pediatric."

21 I would request that a distinction be
22 made between a premature child and a term child.

1 BY MR. SCHOBERT:

2 Q. All right. We will exclude -- well,
3 let's be all inclusive.

4 Do you believe in any population of
5 patients, whether it be a premature infant or in
6 the general population of pediatric patients into
7 adult, that this concept of cytokines being
8 produced as a response to the infection and then
9 causing subsequent vascular injury and the other
10 sequelae, do you believe that that, based on
11 probability, exists and occurs?

12 A. It's a very broad question. And the
13 answer is cytokines can induce vascular injury.

14 And if you have enough vascular injury,
15 you get septic shock. And septic shock can
16 certainly cause organ damage, such as brain damage,
17 kidney damage, liver damage, you name it.

18 But where that chain is not linked quite
19 well is if you get cytokines without septic shock,
20 does it cause injury. And I don't believe there is
21 any data in older children that cytokines in and of
22 themselves, no matter which one we are talking

1 about, cause brain damage.

2 If you get enough cytokine release, you
3 could go into shock and then get brain damage. But
4 cytokines are released -- every time a child has an
5 appendix taken out, there is cytokines released.
6 Every time a child falls out of a tree and breaks
7 his leg, cytokines are released. Every child who
8 gets strep throat, cytokines are released.

9 And no one talks about brain damage in
10 these trivial diseases, even though there are
11 cytokines in the blood.

12 So that's my basic reservation about
13 accepting this damage is that it's not just
14 cytokines. It has to be the quantity of cytokines,
15 the kind of cytokines, the physiologic effect of
16 those cytokines before you can make, you know, a
17 causation argument for cytokines.

18 Because we know they don't harm you or me
19 or people sitting in the room with you there in
20 trivial amounts or the amounts that happen with
21 early infections.

22 Q. Doctor, if -- just so I understand it, if

1 you develop an infection, an individual, let's say
2 an adult individual develops an infection which
3 leads to sepsis; at that point, are cytokines being
4 produced as a natural product of that infection?

5 Is that your understanding?

6 A. Absolutely true.

7 Q. And what you are saying is that it is
8 unclear as to whether if we simply stop at that
9 point and these cytokines have been produced, that
10 those cytokines in and of themselves would lead to
11 potential neurologic -- or lead to neurologic
12 injury.

13 Is that what you're telling me?

14 A. No. I'm not saying it's unclear. I'm
15 saying it's clear that they don't cause neurologic
16 injury.

17 Q. So typically, as you understand it, you
18 have to have sepsis leading to shock, and then the
19 cytokines that are produced within that process
20 itself may lead to subsequent and additional injury
21 or may themselves be the cause for neurologic
22 injury once you have got shock?

1 MR. FINELLI: Objection.

2 THE WITNESS: No. I think at that point
3 the shock is what is causing neurologic injury. We
4 know that happens.

5 BY MR. SCHOBERT:

6 Q. So --

7 MR. FINELLI: I --

8 BY MR. SCHOBERT:

9 Q. -- you don't believe that there's --

10 MR. FINELLI: I'm sorry. Go ahead,
11 Doctor. I interrupted.

12 THE WITNESS: One can induce shock in
13 other ways than cytokine induced shock.

14 You can develop hypovolemic shock or
15 cardiogenic shock without cytokines and certainly
16 infarcts of your brain, cerebral edema, terrible
17 brain damage.

18 There are no cytokines. It's the shock
19 that's causing that process.

20 So I think when you deal with septic
21 shock, it's the shock that is going to cause the
22 brain damage if it occurs, not the cytokines.

1 BY MR. SCHOBERT:

2 Q. So is it your opinion that there is no --
3 there is not significant enough evidence that
4 cytokines, whether they are produced by any
5 process, can result in additional harm to the
6 individual? In other words, is there any link
7 between --

8 MR. FINELLI: Direct or indirect?

9 BY MR. SCHOBERT:

10 Q. -- the production of cytokines and harm
11 neurologically to an individual?

12 A. Certainly if a child has -- you said
13 under any circumstances.

14 Certainly under the circumstance of
15 bacterial meningitis, where there is direct
16 invasion of tissue, meninges, and maybe even
17 cortical brain, with involvement of blood vessels,
18 and then liberation of cytokines at that spot, I
19 think, yes.

20 I think the cytokines are potentially
21 directly involved in the damage to that
22 individual's vasculature and thereby directly

1 involved in damage to that individual's brain.

2 But that's a far different piece than
3 circulating cytokines coming from the chorioamnion
4 into the baby from the maternal circulation causing
5 only brain damage.

6 Q. All right. So, outside of that example
7 you just gave me in terms of cytokines being
8 produced in meningitis, is there any other -- you
9 know, any other area where cytokines are produced
10 by these other processes that we have talked about,
11 how they can be produced and a variety of processes
12 where you believe they are directly involved in
13 harm to the vasculature resulting in neurologic
14 injury?

15 A. Not unless it goes through a shock
16 syndrome.

17 Q. Okay. Now, there is literature --
18 Mr. Margolis has objected a couple of times.

19 There is literature that I think has been
20 out there concerning cytokine production with
21 infection in preterms.

22 Have you read that literature?

1 A. Yes, I have.

2 Q. Do you believe that that literature has
3 established to your -- in your opinion a linkage
4 between those events, a preterm infant infection,
5 cytokine introduction, neurologic injury?

6 A. No, I don't believe so.

7 I think if one looks at that
8 literature -- and it has been a long time since I
9 have, but I have some recollection of that
10 literature -- one can find other intervening causes
11 in almost all of the babies written about
12 purporting to show cytokine direct damage from
13 chorioamnionitis causing PVL in babies.

14 And by that I mean many of these babies
15 are intubated at birth and ventilated for weeks
16 because they have severe RDS, or they have
17 persistent fetal circulation postnatally with
18 profound hypoxia for a long time.

19 It's just very hard to tease out the
20 subsequent neonatal course of many of these
21 premature babies and be able to say there was
22 nothing else but the cytokines from the

1 chorioamnionitis; therefore, we believe it was
2 directly inducing brain damage, PVL, in these
3 babies.

4 Now, if you send me some literature and
5 you want me to read it, I'll be more than happy to
6 do it. And maybe there is more than I have read
7 recently, but that's my residue of that data.

8 Q. All right. Doctor, when we talk about
9 literature, are there certain periodicals or
10 journals that you yourself read on a routine basis?

11 A. Yes.

12 Q. What would those be?

13 A. Pediatric Infectious Disease Journal,
14 Journal of Pediatrics, Pediatrics, New England
15 Journal of Medicine, sometimes JAMA would be the
16 major journals.

17 Q. Doctor, you have used the term birth
18 asphyxia both in your report and in some of the
19 conversation we have had here today.

20 Define that term as you use it.

21 A. Not being a neonatologist, but to me
22 birth asphyxia is hypoxia and hypercarbia.

1 Q. Is birth asphyxia a process or a
2 description of a condition at a given time?

3 A. I think it can be both.

4 Q. All right. Tell me how it can be both.
5 How is it a process?

6 A. It's a process in that it evolves over
7 time. A baby starts off with let's say lack of
8 profusion, and the process of asphyxia starts.

9 If that obstruction to profusion is very
10 brief, the baby will not have hypoxia and will not
11 have hypercarbia and would not then be described,
12 should the baby be seen, as an asphyxiated baby.

13 The other way in which the term is used,
14 and it's a more clinically common use of the term,
15 is in describing a way a baby is at the moment of,
16 let's say, birth and saying the baby is floppy, has
17 no heart rate, has no resp -- no respiratory, has
18 no tone. The baby is asphyxiated.

19 And a blood gas then may be done which
20 would show a hypoxia and hypercarbia and the
21 effects of that on the ph, and that would be the
22 clinical picture of a baby who has been asphyxiated

1 in utero.

2 MR. FINELLI: Just for clarification, can
3 you tell the court reporter hypo or hypercarbia?

4 THE WITNESS: Hyper, E-R.

5 BY MR. SCHOBERT:

6 Q. What values, Doctor, if any, do you
7 utilize to try to determine -- when we are talking
8 about a description, say, at the time of birth,
9 what values would you rely upon or clinical
10 findings would you rely upon to say I believe
11 asphyxia exists in this infant?

12 A. I think the clinical descriptors that I
13 have just given would be commonly used to describe
14 an asphyxiated baby, a baby with very poor tone,
15 with no respirations, with poor color and
16 profusion, potentially with a low heart rate or
17 potentially even with an absent heart rate would
18 typically describe an asphyxiated baby.

19 In terms of blood gas findings, the PCO2
20 would be elevated, usually above 45, the PO2 would
21 be very low, under 20, and the ph typically is very
22 low, usually less than 7.1.

1 Q. When we utilize asphyxia as a description
2 of a condition that exists, say, at the time of
3 delivery, there are many causes for asphyxia;
4 correct, when we describe it as a condition --

5 A. Sure.

6 Q. -- at a given moment?

7 A. Yes. There are many in utero causes of
8 asphyxia.

9 Q. And you have already agreed that one in
10 utero cause of asphyxia could be septic shock?

11 A. Or just sepsis, and then the birth
12 process is enough to asphyxiate some babies, yes.

13 Q. In this particular case, is it your
14 opinion that it's sepsis plus the birth process
15 that lead to -- well, strike that. Let me start
16 over.

17 First of all, it's your opinion that
18 Mackenzie Tarle was asphyxiated by your definition
19 at the time of delivery.

20 Is that a fair statement?

21 A. Yes.

22 Q. And tell me all of the factors that lead

1 you to that opinion from -- I know your general
2 categories, but tell me what you found in the
3 clinical record that causes you to reach that
4 opinion.

5 A. Well, the baby needed to be resuscitated.
6 The baby had such poor functioning at birth, the
7 baby needed to be very aggressively resuscitated.
8 And the baby was found not to have an adequate
9 pulse at birth, found to be limp and apneic at
10 birth and to have blue color at birth.

11 This is all based on the Apgar score of 2
12 at one minute. And I believe some of the
13 descriptions in either depositions or in the record
14 say the baby's heart rate was less than a hundred
15 at the time of birth.

16 There is a blood gas, but I believe the
17 blood gas wasn't done until about an hour of life,
18 6:21 a.m., in fact, a little bit more than an hour
19 of life, where the baby still is significantly
20 acidotic, but is being very well ventilated and is
21 reasonably well oxygenated at that point, having
22 then reserved the hypoxia and the hypercarbia.

1 But the acidosis, which takes a while to
2 correct, is still present.

3 Q. All right. Any other factors you are
4 relying on as it pertains to your opinion
5 concerning Mackenzie Tarle being asphyxiated at the
6 time of birth?

7 A. I believe that was the description or the
8 diagnosis of the baby throughout the hospital
9 records at the Akron Children's Hospital and also
10 at the General Hospital when being evaluated for
11 the neonatal condition.

12 Q. All right. Now, when we talk about
13 sepsis in utero, how do we -- what clinical factors
14 can we utilize to rely on making a determination
15 that sepsis would have occurred in utero in a
16 general context?

17 A. Well, probably in order to know that
18 sepsis occurred in utero, probably the most
19 important determination is to know that a blood
20 culture taken at about the time of birth grew the
21 offending organism.

22 And in this case, we know that that was

1 in fact the case. The blood culture taken on
2 Mackenzie Tarle was positive for Group B strep.
3 And that connotes in utero involvement with Group B
4 strep.

5 And that's not a rare feature of Group B
6 strep. More than half of babies born with Group B
7 strep disease in fact have acquired that infection
8 in utero.

9 Q. Anything else that we can look at to --
10 in a general sense or in this case, utilize to
11 support that Mackenzie Tarle did have Group B strep
12 sepsis in utero?

13 A. The initial blood count that was taken at
14 Akron General Hospital, which was -- I don't have
15 the time that it was taken, but it was taken
16 shortly after birth -- had a white count of 11,800,
17 which is a normal white count.

18 But the baby had nine segs and 18 band
19 forms, which would be commonly seen in a septic
20 baby, that is to say the elevated number of bands.
21 And in this case, the abnormal IT ratio would be
22 part and parcel of a septic syndrome.

1 Q. Doctor, how would we define or determine
2 if an infant, a fetus, has suffered septic shock in
3 utero?

4 A. I think what one would turn to is the
5 clinical course of events post birth to determine
6 whether or not in utero the baby might have been
7 with septic shock.

8 And in Baby Tarle's case, there was no
9 ongoing shock syndrome in the days following birth.
10 The baby had severe asphyxia and the effects of
11 that, which lasted a number of hours, but
12 subsequently had no evidence of ongoing shock,
13 which would mean to me that the baby was not in
14 shock in utero.

15 Q. Let me ask it in a generic way, and then
16 we will get specific to this case.

17 How would -- do you agree with me that in
18 a general sense, an infant could suffer septic
19 shock in utero, a fetus could suffer septic shock
20 in utero?

21 A. Certainly.

22 Q. We have already talked about how we might

1 try to diagnose sepsis in utero. My question to
2 you is how would you, as a pediatrician, diagnose
3 if an infant has suffered septic shock in utero in
4 general?

5 What factors could you look to or, you
6 know, evaluate to determine that?

7 A. Well, the in utero factor -- I mean, the
8 only thing that jumps to mind as it related to the
9 in utero well-being of a baby would be persistent
10 fetal tachycardia as a response to the shock
11 syndrome. That would be a common feature of the
12 septic shock in utero event.

13 There would be no other easy way, other
14 than putting a catheter in the baby and getting a
15 mean arterial blood pressure, in my judgment, of
16 knowing whether a baby had septic shock in utero
17 until the baby is born.

18 And then if the baby post birth went on
19 to have a prolonged episode of septic shock that
20 went on for a number of days, the question would be
21 open as to whether the baby might have been in
22 shock in utero. And you might or might not be able

1 to come up with some reasons for believing such as
2 an infant would be in shock in utero.

3 On the other hand, if a baby is born and
4 post birth is not in septic shock, I think it is
5 very strong evidence the baby was not in septic
6 shock in utero, even if the baby was septic in
7 utero.

8 That is in fact what we have for this
9 baby, for Mackenzie Tarle's case.

10 Q. All right. So in your opinion, just so
11 I'm clear on this, you believe that from the moment
12 of delivery thereafter, there is no evidence that
13 Mackenzie Tarle was in septic shock?

14 A. From the moment of birth, the baby was
15 definitely in shock.

16 And whether it was because of the
17 combination of birth asphyxia and sepsis, a small
18 component of septic shock at that minute, I don't
19 know. I don't know how anybody could really know.

20 All I can tell you is significant septic
21 shock doesn't go away with a couple of boluses of
22 normal saline and one bolus of 5 percent albumin.

1 It is a syndrome that is multiorgan in
2 nature, persistent, and goes on for a number of
3 days.

4 And Mackenzie Tarle was on room air on
5 the day of birth, had very low vent settings, never
6 needed inotropic support for her cardiovascular
7 status, was put on fluid restriction after birth,
8 not extra fluid for ongoing cardiovascular support,
9 but in fact fluid restriction.

10 Never developed respiratory failure.
11 Never had DIC. There is just an awful lot in the
12 record that says once the baby recovered from the
13 shock associated with asphyxia, whether there was a
14 part or not that was contributed by the sepsis, I
15 don't know.

16 But once the septic -- I'm sorry. Excuse
17 me. Once the asphyxic shock was gone, the baby had
18 no more shock.

19 To me that means there was no septic
20 shock in utero.

21 Q. All right. Again, if you could just
22 answer my specific question. And then if you don't

1 understand it, tell me. If not -- if you can't
2 answer it the way I propose it, then just tell me.

3 In your opinion, at the time of the
4 initial evaluation immediate post delivery, from
5 the first evaluations, was Mackenzie Tarle in
6 shock?

7 A. Yes.

8 Q. All right. Next, in your opinion, was
9 Mackenzie Tarle therefore in shock prior to
10 delivery?

11 A. I don't believe she was in shock.

12 And by prior to delivery, let me just say
13 within an hour of delivery. I don't -- I mean, an
14 hour going backwards in labor time, I don't think
15 she was in shock.

16 Q. Well, at any point prior to her delivery
17 in your opinion, based on a reasonable medical
18 probability, was Mackenzie Tarle in septic shock,
19 whether it be one minute, one hour, or one day?

20 Was she ever in your opinion in septic
21 shock prior to her delivery?

22 A. It is a very hard question to answer with

1 respect to the sequence of events that happened in
2 the half an hour before delivery and then the
3 immediate post delivery period.

4 Because we know she was septic. There is
5 no question about that. She had a positive blood
6 culture in the CBC that we have already talked
7 about. And we know she was in shock.

8 And so the question that you are really
9 asking me is whether or not sepsis played a part in
10 that shock, and, therefore, would some people term
11 it septic shock.

12 And looked at that way, yes, I would say
13 it's reasonable to say she had a variety of septic
14 shock in the few minutes before delivery, for the
15 few minutes after delivery.

16 Because without her being septic, I doubt
17 she would have been asphyxiated and therefore she
18 wouldn't have been in shock.

19 So it's almost a logical argument to say,
20 I could call it a variety, if you will, of septic
21 shock. But it was very brief and very limited to
22 those few minutes before delivery and several hours

1 after delivery.

2 But it was not the kind of shock that was
3 ongoing in the hours before she came out. And I
4 could tell you that because of the sequence of
5 events after the third hour of life.

6 I hope that was directed to your --

7 Q. I understand.

8 Were there also positive cultures from
9 her lung with GBS after her -- you know, after
10 delivery?

11 A. I don't believe so.

12 Q. If there were positive lung cultures with
13 GBS after delivery, what, if any, significance
14 would that play in your assessment of what
15 transpired?

16 A. Really no significant assessment.

17 The majority of babies with Group B strep
18 early onset of disease actually have the lung as
19 the focus of that infection. But in a sense, the
20 proof of the pudding is in the eating.

21 What was her pulmonary physiology after
22 birth? She was on room air on day one of life,

1 didn't need the ventilator except to protect her
2 airway, did not have a whiteout of the lung, did
3 not have elevated pulmonary pressures, all of the
4 things that one sees with severe pulmonary
5 involvement with Group B strep.

6 Again, not to say that she didn't have
7 Group B strep sepsis. I just don't think the lung
8 was a major component of that based on how she was
9 to ventilate and what her pulmonary function was
10 over the days following birth.

11 I'm aware of a gastric aspirate that was
12 positive for Group B strep, but I'm not aware of a
13 tracheal aspirate. Maybe I missed it in the
14 record.

15 Q. All right. Let's go through that. All
16 of these factors that you believe indicate to you
17 that while she had a septic shock maybe in the
18 short time interval that you have defined prior to
19 delivery, while you believe that it is that short
20 time interval.

21 I mean, you are telling me all of these
22 post delivery factors cause you to come to that

1 opinion. So let's go through them so I have them
2 listed as to all of the things you believe in the
3 record support that opinion, that it was a very
4 limited amount of time that she would have had GBS
5 septic shock prior to delivery.

6 MR. FINELLI: Hey, Jeff, he also
7 mentioned the in utero factors, which include fetal
8 tachycardia.

9 MR. SCHOBERT: Well, again, guys, I mean,
10 I'm trying to ask him the questions. If he feels
11 that he has not been given the chance to explain...

12 BY MR. SCHOBERT:

13 Q. Doctor, do you understand my question?

14 You have voiced for me a number of times
15 the things that you believe support your opinion
16 concerning a very limited time frame in which there
17 could have been a GBS septic shock prior to
18 delivery; correct?

19 A. Correct.

20 Q. All right. Tell me what all those
21 factors are just so I now clearly have them listed
22 down here.

1 And I assume what you are looking at is
2 all of the post delivery things you have tried to
3 tell me in part about, pulmonary findings,
4 pressors, and those things.

5 A. I'm confused about your question.

6 You want my reasons for my belief that
7 this variety of shock that this girl had in the
8 delivery room, whether we call it septic shock or
9 not, did not continue after the first hours of
10 life?

11 Is that your question?

12 Q. No. I think your testimony to me, if I
13 have understood it, is that while you acknowledge
14 that there was -- there is a Group B sepsis in
15 utero, you do not believe that a Group B sepsis
16 shock would have been existed in utero except for a
17 very limited amount of time potentially prior to
18 delivery and may have contributed in part, although
19 not a substantial part, to this child's asphyxia.

20 Is that what you have been trying to tell
21 me?

22 A. Well, I don't know if that last part

1 would be truly my opinion.

2 I think the Group B strep was a
3 significant reason for her to be asphyxiated, as so
4 babies with Group B strep are asphyxiated.

5 And that is a common reason for asphyxia.
6 Group B strep disease, even without septic shock in
7 utero, can be enough that makes it impossible for a
8 baby to go through the rigors of delivery.

9 And, for instance, if I gave Mr. Finelli
10 Group B strep sepsis right now and asked him to go
11 out and run ten miles and he collapsed on the
12 seventh mile in shock, you know, that's septic
13 shock.

14 It's an unfair variety of septic shock
15 because we have now put two burdens on his
16 cardiovascular system which probably could handle
17 the run without a problem or could have handled the
18 sepsis without a problem, but together they were
19 impossible for him to confront.

20 Well, that's what Group B strep sepsis
21 does to newborn babies. It makes the ability to go
22 through the delivery process a severe enough stress

1 that the babies are born asphyxiated and in shock.

2 And in that way, as I stated to you
3 before, I could say in a logical sense, yeah,
4 that's a variety of septic shock, but it's not
5 septic shock that happens in and of itself. It's
6 septic shock that's pushed along by some other
7 process, in this case the delivery process.

8 The reasons --

9 Q. Well, let's --

10 MR. FINELLI: He's not done.

11 THE WITNESS: The reasons I think the
12 septic shock, if we call it that, was brief and
13 only related to the delivery process are reasons
14 that I have alluded to before.

15 And they include the normal respiratory
16 function of this baby from the first day of life
17 onward. The baby needed room air and only room air
18 within hours of birth.

19 The baby was on a ventilator only to
20 protect the airway by the second day of life, not
21 because of respiratory failure, but because the
22 baby was seizing and they wanted to protect the

1 airway.

2 The baby's cardiovascular system was not
3 in any way compromised to the point where the
4 physicians dealing with this problem at Akron
5 Children's Hospital needed to use cardiovascular
6 support as you would have to in a baby with septic
7 shock.

8 The fluid administration that this baby
9 received was not the fluid administration for
10 septic shock. In fact, they restricted fluids on
11 day one of life.

12 If this baby was in septic shock, I
13 submit to Mr. Finelli, he sued only part of the
14 people who should have been sued, he should have
15 sued the doctors in the neonatal intensive care
16 unit who didn't treat her for septic shock because
17 they only gave her 50 ccs per kilo on the first day
18 of life, which would be about two-thirds of what an
19 average baby would require just for maintenance.

20 They did not give her any pressors on the
21 first day of life, as you would have to if she was
22 in septic shock, because her cardiovascular system

1 was fine.

2 She had a capillary fill time of less
3 than three seconds. She had a mean arterial blood
4 pressure in the mid 40s. She had a pulse rate that
5 normal for a baby of her age, no evidence of
6 ongoing cardiovascular inability to deliver
7 substrate to tissue, which is what shock is.

8 So lung function was fine.

9 Cardiovascular function was fine.

10 Thirdly, there was no evidence in the
11 record that she developed the bleeding diathesis
12 that we often see in septic shock, namely
13 disseminated intravascular coagulation.

14 One can see that in many, many syndromes,
15 but septic shock certainly is -- goes hand in hand
16 with septic shock when it occurs.

17 She didn't have that.

18 So I don't see any evidence in the record
19 following her resuscitation that she had shock of
20 any kind. And that's why I don't think she had
21 septic shock in the general use of that term after
22 delivery or prior to delivery, except for that very

1 localized time period during delivery and right
2 after in the delivery room where I could agree with
3 you in a logical way, you could call it a variety
4 of septic shock, brief and limited and helped along
5 by the delivery process.

6 Q. Doctor, Mackenzie Tarle did receive
7 pressors, did she not?

8 A. On the second day of life, she received a
9 renal dose of dopamine, three micrograms per
10 kilogram per minute, which is not for
11 cardiovascular support, but rather to increase
12 renal perfusion to prevent her from getting worse
13 renal dysfunction.

14 Q. And, as you say, she was intubated;
15 correct?

16 A. She was intubated, yes.

17 Q. How many days did she remain intubated?

18 A. I believe she was intubated for ten days.
19 There was a brief period of trying to extubate her,
20 but she was intubated for ten days to protect her
21 airway.

22 Q. Doctor, you have reviewed the medical

1 records from obviously Akron Children's Hospital;
2 correct?

3 A. Yes.

4 Q. It is your opinion that the care rendered
5 by these physicians was reasonable and appropriate?

6 A. Yes.

7 Q. You have seen, therefore, their diagnoses
8 that they placed in this chart at the time of her
9 discharge from Akron Children's Hospital?

10 A. I think I have seen that, yes.

11 Q. Are you in agreement with them that she
12 had a Group B streptococcal sepsis?

13 A. Yes, she did.

14 MR. MARGOLIS: And, Doctor, take your
15 time and review the document that Mr. Schobert is
16 asking you to review.

17 THE WITNESS: Well, I'm looking at a
18 document here from Children's Hospital that I think
19 is the discharge document 8/20/98 timed at 1730
20 hours.

21 BY MR. SCHOBERT:

22 Q. That's the date I have. I have a summary

1 of that document, Doctor, prepared by a Dr.

2 Vollman.

3 A. I can't read the handwriting.

4 Could you hold up the document that you
5 want me to look at?

6 MR. FINELLI: Are you looking at a
7 discharge summary?

8 BY MR. SCHOBERT:

9 Q. I'm looking at a discharge summary that
10 is dated 8/20/98 prepared by a Dr. Vollman.

11 A. I was looking at the face sheet.

12 MR. MARGOLIS: Take your time.

13 THE WITNESS: We are having trouble
14 finding the discharge summary.

15 Do you know where in your records that
16 appears?

17 BY MR. SCHOBERT:

18 Q. Doctor, as I have tried to explain -- I
19 know it's difficult with this medium we are
20 utilizing -- I did not bring a full set of records
21 with me.

22 I have a pretty comprehensive summary

1 that has been prepared for somebody with my limited
2 abilities, so I'm reading from that rather than
3 looking at a specific document.

4 But I know it's in there because I have
5 gone through this and verified it at an earlier
6 point.

7 MR. MARGOLIS: Dan, it's in the Akron
8 Children's Hospital chart.

9 MR. FINELLI: Yeah, I know.

10 We just...

11 THE WITNESS: Some of my Children's is
12 mixed in with my Akron General.

13 MR. MARGOLIS: Just take your time
14 because I want you to be able to review the
15 document before you answer questions about it.

16 (A discussion was held off the record.)

17 BY MR. SCHOBERT:

18 Q. Doctor, take a moment, as Mr. Margolis
19 has indicated, Doctor, and look at that document.

20 A. Do you want me to read the whole thing,
21 basically, do you want me to?

22 MR. FINELLI: No, you don't want him to

1 read it.

2 BY MR. SCHOBERT:

3 Q. It's not my instruction. It's --

4 MR. MARGOLIS: Yes, Doctor. I'm asking
5 that you take a moment and you review the discharge
6 summary in its entirety because Mr. Schobert is
7 going to ask you questions, and I want you to have
8 reviewed it.

9 THE WITNESS: Okay.

10 MR. SCHOBERT: Maybe the court reporter
11 can read back the question I had proposed to you at
12 the time so we can pickup in context.

13 Do you have that Mr. Court Reporter?

14 (A discussion was held off the record.)

15 BY MR. SCHOBERT:

16 Q. Well, let me see if I can rephrase it.

17 Doctor, I think what I was going to ask
18 you was, Do you agree with the diagnoses placed in
19 the chart by the physicians from Children's
20 Hospital that cared for Mackenzie Tarle?

21 And I was going to ask you first, number
22 one, I -- the first diagnosis I see written is

1 **Group B streptococcal sepsis.**

2 And by your testimony, you agree that
3 that was a diagnosis for this child; correct?

4 A. Correct.

5 Q. Number two says, Shock due to sepsis and
6 blood loss; correct? That's what they have written
7 down?

8 A. Yes, that's what they have written down.

9 Q. Do you disagree with them when they write
10 that this child had shock due to sepsis and blood
11 loss?

12 A. I think the conclusion about blood loss
13 is more a logical conclusion than a proven fact in
14 the record.

15 And I so that for the same -- and I would
16 probably come to the same clinical question myself
17 in dealing with a baby whose hematocrit dropped as
18 much as this baby's hematocrit dropped in the
19 several days from birth to I think to August 7, her
20 hematocrit was 29.

21 That to the treating doctors suggested
22 some blood loss in utero.

1 Whether that's true or not, I don't
2 really know because sepsis, Group B strep sepsis is
3 another reason for blood loss. And taking blood
4 out of a baby and administering fluids and so on
5 can cause hemodilution.

6 So this is -- I'm not disagreeing with
7 the possibility of blood loss, but I don't think
8 it's truly established in the record.

9 Q. Okay. How about No. 3, Delayed
10 adaptation in the delivery room?

11 A. Certainly, absolutely.

12 Q. All right. And No. 4, Hypoxic ischemic
13 encephalopathy. You agree that's a diagnosis?

14 A. Yes.

15 Q. Going down through the rest of those
16 lists, is there anything on that list from the
17 next -- from 5 through 9 that you disagree with in
18 terms of diagnoses?

19 A. No. They were all diagnoses to this baby
20 at some point during the course of her life in the
21 first two weeks of her life, yes.

22 Q. Doctor, what role, if any, do you believe

1 a review of the placental pathology could play in
2 determining the length of time that an in utero
3 infection may have existed?

4 MR. FINELLI: Objection. He is not a
5 pathologist.

6 MR. SCHOBERT: I'm just asking generally
7 whether he believes, based on his knowledge -- from
8 his background of pediatrics, whether that
9 placental pathology could play a role in
10 determination of the length of time infection may
11 have existed in utero.

12 MR. MARGOLIS: Objection.

13 BY MR. SCHOBERT:

14 Q. And if you don't have an opinion, that's
15 fine.

16 A. I don't have an --

17 Q. I just want to know.

18 A. I don't have an opinion about that.

19 Q. What about the utilization of head
20 studies, MRI, ultrasonography, or CT imaging of an
21 infant's brain?

22 Do you believe that it can play any role

1 in the timing or in a determination as to a
2 causative event of neurologic injury in the
3 newborn?

4 MR. FINELLI: Objection.

5 THE WITNESS: I don't have an opinion
6 about the usefulness of CT scans, MRIs, and
7 ultrasounds in trying to time Mackenzie Tarle's
8 injury.

9 BY MR. SCHOBERT:

10 Q. Now, you made a -- one of your early
11 notes that you read to me from the front of the
12 transmittal letter I think said, If delivered plus
13 or minus six hours?

14 A. Yes.

15 Q. All right. Explain to me, if you would,
16 in a little more detail what you mean by that
17 statement, and then I'll ask you some subsequent
18 questions.

19 A. Well, I know the delivery time of
20 Mackenzie was 5:16 a.m. And so I think what I
21 meant by writing this is that, you know, by 11
22 o'clock at night, there is a fair chance the baby

1 didn't have Group B strep sepsis yet, which would
2 be another way of saying if she were born, she
3 would never have Group B strep sepsis. And any
4 issue relative to Group B strep sepsis would be
5 evaporated.

6 Or that if she did have Group B strep
7 sepsis, it would have been so early that there
8 would be no chance that it would participate in an
9 event that might cause shock, brain damage, the
10 things that we have been discussing now for the
11 last hour and a half.

12 Q. Doctor, how do you make the determination
13 when there is significant enough Group B strep
14 sepsis that might be going on in the fetus, that
15 the rigors of delivery -- in combination with the
16 rigors of delivery, the child could suffer shock
17 and the result asphyxia.

18 How do you determine how much sepsis is
19 enough in order that a child cannot undergo the
20 rigors of delivery without some resulting sequelae
21 like this?

22 A. I don't know any operative way to

1 definitively say that.

2 I would think that cesarean section
3 delivery induces less interruption of profusion of
4 the baby's organ systems such as that cesarean
5 section would be less of a challenge to any baby
6 with Group B strep disease at any stage of that
7 evolution.

8 And I believe --

9 Q. Well, you said -- go ahead. I'm sorry,
10 Doctor. It's the medium. I apologize. Go ahead
11 and finish.

12 A. And so that the delivery that I'm talking
13 about here was a cesarean delivery. A C-section
14 done at midnight or 11 o'clock at night, more
15 likely than not, would have been before the baby
16 developed Group B strep or well before any issue
17 could probably arise that Group B strep could
18 complicate that more lenient variety of delivery.

19 Q. All right. And my question then to you
20 is give me the reasons or the, you know, what you
21 are relying on to say that, A, you don't believe
22 that the child would have had developed Group B

1 strep sepsis by 11 p.m. the evening before.

2 A. Well, again, I didn't say that.

3 I said the combination of those two
4 things would more likely than not give rise to a
5 health baby. That is to say, there was the
6 significant chance Mackenzie Tarle had not yet
7 developed Group B strep by 11 o'clock at night.

8 Whether that's more than 50 percent
9 likely, I don't really know, but a significant
10 chance the baby was not yet infected.

11 And if the baby were infected, it would
12 have been so early in the disease that I would
13 aghast at the idea that a cesarean section delivery
14 would be a challenge to the baby who was early with
15 Group B strep disease.

16 But the reason for thinking that Group B
17 strep was less likely at 11 than it was at 5 is the
18 average thinking about the evolution of Group B
19 strep disease in any neonate, the early onset
20 variety anyway.

21 And that is it follows suit with maternal
22 chorioamnionitis. Membranes are ruptured over a

1 period of hours. Those membranes may become
2 infected. And by about 12 hours, that gets to be a
3 common enough thing, chorioamnionitis gets to be a
4 common enough thing that one could pose the
5 likelihood in a baby like Mackenzie Tarle and her
6 mother that chorioamnionitis was established by
7 about 12 hours after ruptured membranes. That
8 would be average.

9 And then usually it takes several hours
10 after that for a baby to become infected with the
11 Group B strep or other organism that is causing the
12 chorioamnionitis.

13 So if one just does the average
14 progression of events, membranes are ruptured at
15 7:25, I think or 7:30.

16 MR. FINELLI: 7:45.

17 THE WITNESS: 7:45 in the morning. 12
18 hour later, it is 8 p.m. at night. Several hours
19 after that Mackenzie Tarle is infected.

20 If everything follows the way it's
21 supposed to follow, that's 11 o'clock at night.
22 That's six hours before the baby is born.

1 And that's where that number comes from.

2 BY MR. SCHOBERT:

3 Q. Well, Doctor, let me see if we can just
4 cut to the chase.

5 Do you have an opinion based on
6 reasonable medical probability when this infection
7 was -- when the organisms that resulted in
8 infection were first introduced into the amniotic
9 fluid?

10 A. Into the amniotic fluid?

11 Q. Well, yes.

12 A. The way you asked the question, I would
13 probably think within several hours of membrane
14 rupture.

15 Q. So it's your opinion -- let's ask it this
16 way. Prior to membrane rupture, it's your opinion
17 based on a reasonable medical probability, that
18 there was not the introduction of a Group B strep
19 bacteria into the uterus?

20 A. Yes, more likely than not.

21 Q. And the basis for that opinion is what?

22 A. Is that typically membrane rupture is

1 what allows Group B strep to ascend into the uterus
2 of term pregnancies.

3 And that's quite different from preterm
4 pregnancies where in fact the pre-existing
5 chorioamnionitis can be a cause for premature
6 rupture of fetal membranes.

7 This was at term, actually a little bit
8 post term.

9 Q. You say typically it is introduced at the
10 time of rupture of membranes.

11 The implication of that is that there are
12 times when the GBS bacteria could be introduced
13 even prior to the rupture of membranes.

14 Is that an inaccurate statement?

15 A. That's true. That can happen.

16 Q. Is there any way in the case of Ms. Tarle
17 that you can rule out the fact that this could have
18 been introduced prior to the rupture of membranes
19 based on all of the materials you have reviewed?

20 A. I think a couple of things. The two
21 things that would argue against this Group B strep
22 having been there for 21 hours before Mackenzie's

1 delivery, rather than six or eight hours before
2 Mackenzie's delivery, is the absence of severe
3 Group B strep disease in Mackenzie herself, which
4 means she probably had a pretty early infection at
5 the time of delivery.

6 And then number two, the presentation of
7 maternal fever, which I think was at about 4:30 in
8 the morning, something like that -- let me get the
9 right time. 4:25 was the temperature of 38.5.

10 I would expect Ms. Tarle to have fever
11 earlier than that if in fact she had amniotic
12 infection prior to the rupture of her membranes. I
13 would have not have expected her to wait 20 hours
14 for the fever.

15 Q. Any other factors you are relying on?

16 A. I think they are the only two.

17 Q. All right. Now in your opinion, based on
18 reasonable medical probability, when did sepsis
19 arise in Mackenzie Tarle?

20 A. I can't give you an exact moment in time.
21 I could give you a range of when I think Mackenzie
22 probably became bacteremic or septic with Group B

1 strep.

2 And that range of time would be, knowing
3 that she was born at 5:16 or 5:17, I would say on
4 the long end, 12 hours before birth, on the short
5 end, a couple of hours before delivery would be the
6 range of when it --

7 **Q. And again -- I'm sorry. I apologize. I**
8 **should look at you. I stop hearing you for a**
9 **second and I think you are done. I'm sorry.**

10 A. Those would be I think the ranges, the
11 long end and the short end, as to when Mackenzie
12 might have become infected with Group B strep.

13 **Q. And, again, the factors you are relying**
14 **upon for that opinion.**

15 A. The factors are the absence of severe
16 disease in the baby post birth, again meaning
17 probably pretty recent infection.

18 And then number two, the statistical
19 knowledge that most Group B strep in most term
20 babies occurs after a prolonged period of fetal
21 membrane rupture.

22 And we know when the membranes ruptured.

1 And usually there is a quiet period before Group B
2 strep gets to anything after membrane rupture.

3 MR. MARGOLIS: Can we take a break?

4 MR. SCHOBERT: Yeah, I'm almost done, but
5 go ahead.

6 BY MR. SCHOBERT:

7 Q. Anything else, Doctor, but before we take
8 a quick break?

9 A. I think not.

10 (A recess was taken at 10:56 a.m. until
11 11:03 a.m.)

12 BY MR. SCHOBERT:

13 Q. Doctor, in your opinion, based on
14 reasonable medical probability, at what point -- by
15 what point did this child need to be delivered by
16 any means to avoid neurological sequelae that this
17 child has experienced?

18 A. Well, I'm not an obstetrician, but I'll
19 answer it as I would a pediatrician looking at --

20 Q. Well, I'm asking you to look at it from a
21 damage standpoint.

22 By when do you believe a delivery -- and

1 I'm not asking you to talk about obstetrical care
2 but when you believe delivery would have -- could
3 have contribute -- if it occurred by that point,
4 you believe based on a probability this child would
5 not have suffered any neurological sequelae or at
6 least a different outcome in that regard?

7 A. Right. Well, I think it goes up to that
8 period of time when the prolonged bradycardia
9 began, whether that would be 20 minutes or a half
10 an hour before delivery, I don't remember as I sit
11 here, but in about that period of time.

12 I think cesarean section delivery would
13 have prevented the complication of Group B strep
14 from causing disease of the baby's brain.

15 Q. And, again, give me just the overview of
16 factors in support of that opinion so I have a
17 clear record to review in that regard.

18 A. Okay. I think it's pretty much what we
19 have already talked about several times, and that
20 is the delivery process, a vaginal delivery,
21 because it can interfere with blood supply to
22 babies by compression of the cord, during sepsis,

1 that interruption can be catastrophic.

2 And I think that's what happened here,
3 and I think that's what the bradycardia in this
4 baby's case really was reflecting, the combination
5 of the stress of labor on top of the stress of
6 Group B strep disease caused this baby to have very
7 poor perfusion of brain.

8 If you got to the baby by cesarean
9 section before that stress was put upon the Group B
10 strep disease, the baby would not have had brain
11 damage.

12 Q. When you say the stress of labor is put
13 upon the Group B strep -- I think that's how you
14 said it. If I misphrased, that correct me -- but
15 explain that path of physiology to me. I guess I
16 want to understand what you mean when you say that.

17 A. Well, I really mean the stress of the
18 delivery process, when the baby is coming through
19 the lower birth canal and the umbilical cord is
20 compressed, either from contractions or because of
21 the baby's position, that poor perfusion of the
22 baby, who is already stressed with sepsis, is what

1 puts the baby into an asphyxial mode with poor
2 profusion of organs, hypercarbia, hypercapnia,
3 acidosis, and the ensuing brain damage.

4 Q. So what effect is the sepsis having?

5 Let's just say the moment before the
6 delivery process beginning, where she starts to
7 push, and the baby starts -- they start into that
8 second stage of labor.

9 What is the sepsis doing to that fetus at
10 that moment?

11 A. Well, I think it is probably taxing the
12 baby cardiovascularly, making it harder for the
13 baby to provide substrate to every organ.

14 The baby is working maximally to do that.
15 And I think I used the example of someone doing a
16 very arduous physical activity where your cardiac
17 output is now sort of maximized, and then you are
18 asked to do more.

19 You can't confront that extra, so you go
20 into a failure mode, in this case shock.

21 Q. Okay. And this blood loss that we had
22 talked about as being something that was in the

1 diagnosis at Children's hospital, would it be fair
2 to state based on a probability that this process
3 that's going on at that point leading up to the
4 beginning of the pushing, the labor, the actual
5 delivery itself, was there blood loss occurring to
6 the child at that point?

7 A. Well, I don't believe there would be
8 quote, unquote blood loss occurring to the child
9 because of Group B strep disease.

10 That disease can cause hemolysis. And if
11 it's longstanding enough, you know, a baby can be
12 born with a very low hematocrit.

13 That's not the case for Mackenzie. She
14 didn't have a low hematocrit.

15 The kind of hemologic features she did
16 manifest are more consistent with the real true
17 blood loss, like an abruptio placenta or a ruptured
18 cord or some other significant gross bleed that
19 deprived the baby of blood volume.

20 Not the kind of anemia you see with
21 severe sepsis where the blood volume isn't changed,
22 the amount of circulating red cells is changed.

1 She didn't have that.

2 So I don't think the Group B strep in
3 this case is the etiology for this quote, unquote
4 blood loss, if it occurred.

5 And I don't have an etiology. I know
6 there is talk in the record about an abruption. I
7 have no opinion about any of that, and I don't even
8 know that for a fact she had blood loss.

9 Q. Well, I thought you said to me in some
10 earlier testimony that there was evidence of a
11 dropping hemoglobin hematocrit in her post delivery
12 records. Is that correct?

13 A. That is true.

14 Q. And what is your opinion based on
15 reasonable medical probability the cause of that?

16 A. I think there are two ways to explain it.
17 One is that the baby had blood loss
18 somehow, and that blood loss could be post birth or
19 prebirth.

20 It could include things like attempting
21 to put umbilical arterial catheters in and some
22 bleeding at that particular emergency time. It

1 could be bleeding into the lungs from Group B strep
2 pneumonia. It can be bleeding into the GI tract,
3 bleeding into the head from poor perfusion and
4 infarcts.

5 There can be a lot of ways in which a
6 baby can have blood loss post birth. It could be
7 prebirth. We already talked about abruptio. I
8 have no idea, but obviously that's a classic cause
9 in the way of a baby with blood loss.

10 The second way in which this baby could
11 have had blood loss is the typical way in which
12 sick babies in intensive care units develop anemia.
13 It is iatrogenic. People have taken out so much
14 blood over the first three days of life for
15 chemistries, blood gases, CBCs, you name it, that
16 they get to a point where they have made the baby
17 anemic and have to transfuse the baby.

18 And on top of that, a baby with Group B
19 strep disease, you can expect some hemolysis.

20 So I can't sit here and tell you amongst
21 those possibilities what was the cause of this
22 baby's anemia. It could have been any of those

1 causes.

2 But I would agree, the baby did develop
3 anemia and actually had a hematocrit of I believe
4 26 or 29 on the third day of day of life, which
5 obviously has to have a reason behind it.

6 And I think I have given you sort of a
7 panoply of the possible reasons.

8 Q. Hypothetically, Doctor, if you had a
9 child that had developed Group B sepsis in utero
10 and had a significant -- or had a blood loss in
11 addition to that, would that make them even more
12 likely for some type of neurologic sequelae, the
13 combination of those two events?

14 A. I think absolutely it would. I think
15 those two events would be yet another stress on
16 this baby's capability of delivering substrate to
17 the brain.

18 And an in utero significant anemia and
19 Group B strep and delivery could be a catastrophic
20 combination for a baby.

21 Q. Now, Doctor, hypothetically if Mackenzie
22 Tarle had been delivered vaginally at midnight

1 based on your opinions concerning the underlying
2 sepsis that she may have had at that juncture --
3 and I know you have explained all of that, and I'm
4 not trying to go back and recreate all of that.

5 But assuming hypothetically she was asked
6 to undergo the rigors of delivery at that time, a
7 natural delivery, do you have an opinion as to what
8 her outcome would have been in this case?

9 MR. FINELLI: Objection.

10 THE WITNESS: I think statistically it
11 would have been better. More likely than not, she
12 would have had a better outcome.

13 Much more than that, I can't say.

14 BY MR. SCHOBERT:

15 Q. So you have no opinion as to whether or
16 not she might have still suffered some degree of
17 hypoxic ischemic encephalopathy based on the
18 combination of the rigors of the labor and delivery
19 process as well as the underlying Group B sepsis to
20 the extent it would have existed at that time?

21 MR. FINELLI: Objection.

22 MR. MARGOLIS: With vaginal birth?

1 MR. SCHOBERT: With vaginal birth.

2 MR. FINELLI: Objection.

3 THE WITNESS: I guess I would agree with
4 the way you phrased my opinion.

5 There would be some subset of babies like
6 Mackenzie delivered at midnight by vaginal delivery
7 who would not yet have had Group B strep disease.

8 In which case, her risk of brain damage
9 is whatever the risk is for any baby, term baby
10 with a vaginal delivery.

11 There are other babies who would have had
12 Group B strep syndrome for, you know, one hour, and
13 be so early in it that the vaginal delivery would
14 not impact on the Group B strep syndrome; or, to
15 put it better, the Group B strep syndrome would not
16 impact on the vaginal delivery.

17 And you could do that almost like in an
18 integral fashion. If you are familiar with
19 calculus, for every hour or every increment of time
20 where you add -- okay, now she has had Group B
21 strep for two hours, what would that mean.

22 But I think in general, you would wind up

1 with a better outcome in Mackenzie at midnight
2 delivering vaginally than you would at 5:30
3 delivering vaginally, but I can't say with more
4 likely than not certainty it would have meant a
5 normal Mackenzie Tarle.

6 Q. And, Doctor, if I understand it, in your
7 opinion -- again, in a hypothetical, assuming that
8 Mackenzie Tarle had not had Group B strep sepsis at
9 any time prior to her delivery, and assuming that
10 she had gone ahead and vaginally delivered in that
11 time frame of 5 to 6 a.m., it's your opinion based
12 on a reasonable medical probability she would
13 have -- you see no reason that she would have had
14 any asphyxia leading to potential neurologic
15 injury.

16 Is that a fair statement?

17 MR. FINELLI: Objection.

18 THE WITNESS: It's a fair statement if
19 I'm able to discount the issue of abruptio placenta
20 that I read in the record, but which I don't find
21 substantiated anywhere.

22 Clearly a baby with abruptio placenta can

1 have fetal distress and then be born asphyxiated.

2 And I know it's stated in the record that
3 there might have been an abruptio placenta, but I
4 don't know that, and it's not further clarified in
5 any of the documentation that I read.

6 So if we exclude the abruptio placenta,
7 then I would answer the way I have answered.

8 Q. Doctor, if cytokines are produced as a
9 result of septic shock, which I think we have
10 discussed you believe that is one way they can be
11 produced --

12 A. Cytokines can cause septic shock.

13 They are not produced as a result of
14 septic shock. They are the cause of septic shock.

15 Q. All right. So sepsis results in the
16 production of cytokines, which then result together
17 in septic shock.

18 Is that simplistically what you are
19 telling me?

20 A. Yes. Can result in septic shock.

21 Q. Can result?

22 Once cytokines have been produced as a

1 result of the underlying sepsis, is there anything
2 that can be done treatmentwise to stop whatever
3 effect these cytokines may have on the vasculature
4 of an individual?

5 A. There may be some experimental modalities
6 of therapy, but there is no clinically available
7 standard therapy that can reverse the effect of
8 cytokines until they have gone by their half-lives.

9 Q. Doctor, in the discussion of cytokines, I
10 have -- strike that. Let me ask it this way.

11 If you have somebody with sepsis and you
12 begin the antibiotic therapy for the sepsis itself,
13 what effect, if any, does that have on cytokine
14 production?

15 A. I think it has two effects.

16 Oftentimes, there is an initial effect
17 whereby the death and dying of the organism
18 elaborating more cell wall products or releasing
19 more cell wall products, it has been shown that
20 some patients have a boost in their cytokines
21 transiently immediately after therapy is started.

22 But the long-term effect of therapy is

1 to, a day later or two days later in the face of
2 antibiotics, to prevent the growth of these
3 organisms and thereby diminish the production of
4 cytokines.

5 Q. Doctor, if there was a study that
6 demonstrated that there was a significant
7 association between abnormalities in the neurologic
8 examination and cytokine concentrations with the
9 highest cytokine concentrations observed in infants
10 who developed HIE seizures -- and we are talking
11 about term infants -- would you be in a position to
12 dispute those findings?

13 MR. FINELLI: Objection.

14 THE WITNESS: Well, I would be in a
15 position to review the subset of data that --

16 BY MR. SCHOBERT:

17 Q. Dispute this -- I mean, would you, based
18 on your knowledge of this area, would you be in a
19 position to disagree that those findings would
20 suggest this association between those two factors?

21 MR. FINELLI: Objection.

22 MR. MARGOLIS: I'm going to object, and

1 I'm going to instruct -- this is Mr. Margolis.

2 I am objecting. I'm going to instruct

3 Dr. --

4 MR. SCHOBERT: I will withdraw the
5 question.

6 BY MR. SCHOBERT:

7 Q. Doctor, if you assumed that a study had
8 been done where there had been a significant
9 association developed between abnormalities and --
10 with neurologic exams in the recent -- in a child
11 just delivered, and an association in those same
12 infants of increased cytokine concentrations, what
13 might that say to you as a pediatrician?

14 MR. MARGOLIS: I will object.

15 Doctor, he is asking you to make certain
16 hypothetical assumptions.

17 THE WITNESS: Well, I would want it --

18 BY MR. SCHOBERT:

19 Q. I'm asking you to -- go ahead, Doctor.
20 I'm sorry.

21 A. I would want to know a lot more about the
22 patients than just their neurologic exam and their

1 cytokine level. That's certainly not the way
2 medicine is practiced, and that's certainly not the
3 way research is done.

4 I would want to know whether there are
5 any other factors offered in those patients that
6 might bridge the cytokine and the neurologic exam,
7 such as septic shock, meningitis, severe
8 respiratory distress with hypoxia, hypoprefusion of
9 the brain with persistent fetal circulation.

10 I mean, many other things that might be
11 related to the cytokines, not directly the brain
12 damage, but some other disease that then gives
13 forth the brain damage. That's what I would look
14 at in those -- in that data set.

15 MR. SCHOBERT: Doctor, I don't have any
16 further questions. Thank you.

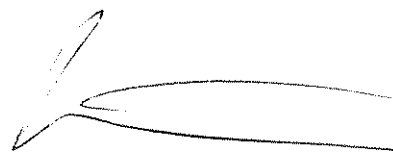

17 MR. FINELLI: We will read and sign.

18 (Thereupon, Deposition Exhibit No. 1 was
19 marked for identification.)

20 (Whereupon, the proceedings in the
21 above-captioned matter were concluded at 11:21
22 a.m.)

CERTIFICATE OF REPORTER

I, Joseph A. Inabnet, do hereby certify that the proceedings in the foregoing matter were taken by me in Stenotype and thereafter reduced to typewriting under my supervision; that said transcript is a true record of the proceedings; that I am neither counsel for, related to, nor employed by any of the parties to the action involved in these proceedings; and further, that I am not a relative or employee of any attorney or counsel employed by the parties thereto, nor financially or otherwise interested in the outcome of the action.
